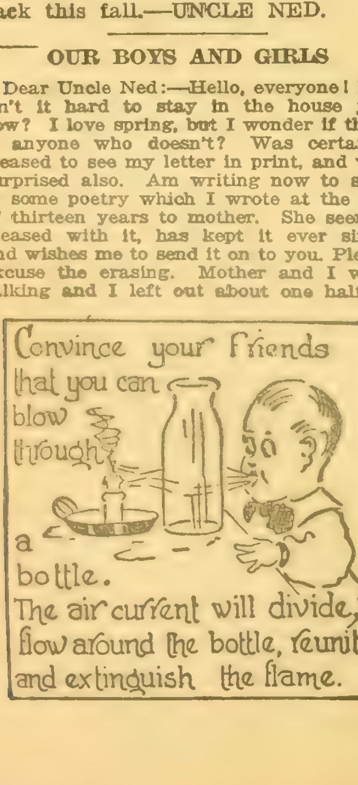
Dear Uncle Ned:—Hello, everyone! My, isn't it hard to stay in the house just now? I love spring, but I wonder if there is anyone who doesn't? Was certainly pleased to see my letter in print, and was surprised also. Am writing now to send in some poetry which I wrote at the age of thirteen years to mother. She seemed pleased with it, has kept it ever since, and wishes me to send it on to you. Please excuse the erasing. Mother and I were talking and I left out about one half of what I wanted to say. Believe I will say farewell now, until next time. Cousins, I promise, on my honor to answer every letter received if more of you will write. Wishing success to all of you, I am.—Iola E. Hardy, Mayville, Mich., R. 3.
—Your poen to "Mother" is very beautiful and I am publishing it in this issue at the head of this department.



Convince your friends that you can blow through a bottle.
The air current will divide, flow around the bottle, reunite and extinguish the flame.

Dear Uncle Ned:—May I become a member of the merry circle again? I have written before and have had some of my letters in print but I thought I would write again. Well it will soon be summer again so we can go to the lakes camping. How many of you have written on the state examinations yet? I wrote yesterday (May 15) and today I wrote at our school in history, arithmetic, and grammar so I am all through and do not have to go to school for awhile. I will now describe myself. I have light brown hair (which is bobbed), blue eyes, and a light complexion, I am thirteen years old. I cannot tell what grade I am in because I don't know myself as I haven't heard yet from my standings. We are going to have our school picnic next Tuesday, we are going to a lake but I expect it will be too cold for us to go in bathing. Can you swim, Uncle Ned? I can swim, and I think that and dancing is great sport. I have something all together different this time then the boys and girls are having to guess, and this is: Where am I writing this letter? This will be fun because there are so many places that you could be writing a letter. The one that guesses the funniest place will get a booby prize. If you would rather tell me when your birthday is I will send it to you then. Now remember you can only have two guesses. Well I guess I had better close as it is getting dark. Now can you guess? I guess I fooled you this time. You try too Uncle Ned. Your niece.—Miss Ruth Nelson, R. 2, Grant, Michigan.
—Yes I can swim some.

Dear Uncle Ned:—Hello! How is everybody? I thought I would try my luck again. Mr. Waste Basket got my other letter. Hold on! I guess I had better describe myself before I say any more. I am twelve years old, have black hair, grey eyes, dark complexion and am 5 foot 6 inches tall. I have been a silent reader of the M. B. F. for quite a long time. I weigh 140 lbs. I just wonder how many of the boys and girls can beat that in being heavy? I will be 13 years old the 3rd of June. School is out now. It was out the 28th of April. I passed my grade. I am a 5th grader. I have four brothers. I live just 30 feet from Walloon Lake. That is quite near a lake isn't it? Oh! I forgot to tell you that my hair is bobbed. But I guess I had better stop my scribbling for Mr. Waste Basket looks pretty hungry. Ha! Ha! Will some of the boys and girls write to me? I will answer all letters I get, even if it is a hundred. Good-bye, your-want-to-be-niece.—Hulia E. Weller, Boyne City, Mich. Route 2.
—So you will answer all the letters you receive. Well, if the cousins are in a writing mood I can see how you will spend your vacation this summer.

Dear Uncle Ned:—May I enter into your merry cirlcle? I am 11 years of age. We have 2 horses, 5 cows, 56 hens, 30 chicks, 4 pigs and live on a 40-acre farm. I wish some one would write to me. I will answer them. I have light brown hair, blue eyes. It is Sunday evening. I cannot draw a picture because I do not know how. We got 27 eggs today. There are 25 children in our school. I am in the 5th grade. My height is 4 feet 7 inches. Your nephew.—Clare Crittenden, Breckenridge, Mich., R. 4.

Dear Uncle Ned:—I thought I would write again as I wrote one before and my letter must have gotten in the waste basket as I did not see it in the paper, though that was quite awhile ago. I live on a forty-seven acre farm a little east of Leslie with my father, mother and my 10-year-old brother. My brother and I go to the Leslie public school and we have only a mile to go. I like school very well and I also like my teacher very well. I am in the sixth grade. I am four feet and eight inches in height, weigh about seventy-three pounds, have medium brown hair and it is bobbed. I have blue eyes, have a light complexion, and am twelve years old and will be thirteen the tenth of September. I wonder if I have a twin? I would like to have some of the readers of the Children's Hour write to me and I will gladly answer their letters as I enjoy receiving letters from boys and girls. I think it would be interesting to have some of the children that write stories to write about some of the things that they used to do when they were small. Something that they used to be afraid of or some comical things that they used to do. I am sending a composition about some of my early fancies. It is a copy of the one I wrote for school. Your want-to-be-niece.—Ruth Esther Blackmore, Leslie, Michigan, R. 4.

Some of My Early Fancies.

Grandma used to sell stockings and she had stocking sample books with all kinds of stockings in them and after she was through with the books she gave them to Lee and I. We were always asking grandma if she had some more stocking books for us. After she gave them to us we would take them out doors where the chickens were and showed each one the different kinds of stockings and would ask them which kind of stockings they would like to buy and told them the price of each. We would act like agents just getting orders for the stockings. We used to have lots of fun playing agents. We had many chickens named so we would call them by name when we ask them if they would like to buy some stockings. Among the ones we had named were Picky-Pick, Grandma Hen, Henny Penny, Speckle Biddy, Yellow Biddy, Red Biddy, Brown Biddy, and Mother Hen.

One evening I was sitting on papa's lap on our front porch watching the lightning bugs down by the ditch on the lower land just north of our house. I asked papa what they were and he told me that they were lightning bugs carrying lanterns. Then I kept asking him about them as I got so excited about it. I usually got so excited about anything like that anyway so to get my mind off from that he said, "Let's talk about the beans that papa is going to raise to eat this summer."

Then I said, "Papa, papa, I didn't know that lightning bugs carrying lanterns ate beans!"

I was always afraid of flies, bumblebees, wasps, and all other insects. If mamma put me on the front porch and I saw an insect of any kind I would begin to cry for her. And one day when I was out on the front porch two men were going by with a horse and buggy and I began to call to them saying, Shies, bumble-bees, wasps." They just looked around and laughed at me.

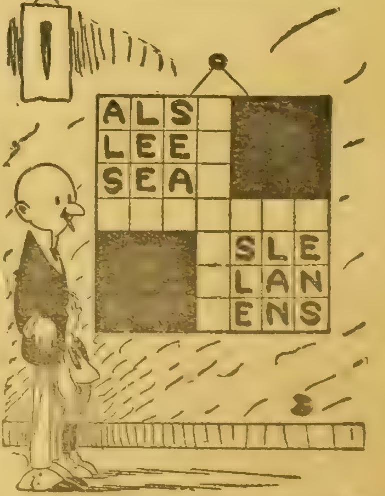
I was very afraid of automobiles as there were only a few then. Mamma had always taught me not to go out in the road or would get run over so every time I would see or hear one coming I would start and run out back of the house if I was in front of it. And one time I heard a car coming so I began to run out back of the house and I just got half way around when I stubbed my toe and fell down and then I began to scramble around to get up and run again and just then I looked up and saw the automobile just going by, then I said, "Well, there it goes."—Ruth Esther Blackmore.

Dear Uncle Ned:—May I come in? I should like to very well. I will describe myself. I am 5 feet 2 inches tall, have blonde hair (bobbed of course) and grey eyes, I am between 10 and 16 years of age. Now all of you must guess my age, the one or ones who guess it correct will receive from me a nice long letter and besides will receive a nice gift. I live on a 60 acre farm. We have 5 cows, 5 horses and 12 sheep. For pets I have a dog and 2 cats, one is spotted, and one is coal black so I call him "Nig". We also have one little brown and white spotted calf and 2 little twin lambs. I can play some music on an organ but I do not play by note, I play by ear. We also have a phonograph. I have two sisters and two brothers living and one brother and one sister dead. Well I must close for my letter is getting long. From your want-to-be-niece.—Florence Coleman, Ithaca, Michigan.

Dear Uncle Ned:—I wrote once to the Children's Hour and saw my letter in print, and wrote again but I guess it found the waste basket. Amber Holmes was the only one that guessed my name right. It is raining awfully hard here tonight. I guess we aren't going to have any summer. I and my cousins and my sister and brother went about 2 miles last Sunday gathering May flowers. We got a nice lot. There is some trailing Arbutus around here too. Now I will close hoping that this letter doesn't go to the waste basket like my last one. I am,—Bernice Durfee, R. 1, Alger, Mich.

IT'S A BIRD

By Walter Wellman



All you have to do is to print the name of a large bird in the horizontal column, and the same name in upright column. If you print the name of the right bird, you will have a continued square, in which all the words will read from left to right the same as they do downward. what is the bird?

Uncle Rube Spinach Says:

NOT FEELIN' VERY GOOD

MY good friends, I ain't been feelin' very good for quite a long spell—kinda off my reg'lar health you know—an' I've been to doctors an' sim'lar—they've told me a lot of things, things I don't believe an' you wouldn't either. Why don't you see, I've got everything 'at any human bein' ever had—adenoids, bad tonsils, yellow liver, decayed kidneys, and a lot of other things too numerous to mention. Well, I've let 'em take out most every thing—adenoids, liver an' such—now I have a bad headache, what will the doctor take out to stop that?

I wonder if we don't sometimes kinda 'magine a lot of these ailments? Of course I know we feel bad some times—I do, so do you. But a doctor can talk you into worse sickness 'n you've ever known of. An' if he don't your dear friends can do it—yes they surely can! And while I thought I was awful sick, shucks I wasn't so bad any of the time as I thought I was. I had a good doctor an' he told me just what to do—gave me medicine to take an' I took it folks. I wuz in my bed jest about 3 weeks and then I got kinda mad. I sez to myself, "I don't believe any such stuff." Doctor wanted me to have an operation—tumors in the stomach he said an' an operation was the only thing 'at would save my life. Think of it folks—one little ol' life up agin' two or three doctors an' I took a chance of livin' without bein' cut into. An' I'm livin' yet an' that's more'n lots can say 'ats let the doctors cut 'em up.

Well let's talk 'bout somethin' else. Spring is here an' beautiful ain't it? An' summer is comin' right along an' bathin' out to the lake an' everything nice out there. An' greens, mushrooms an'—yes most every thing—silk stockin's, low shoes, nice folks—oh everything most happens in the good ol' summer time. Robbins build their nests, folks git married an' divorced—love an' everything comes in the summer.

An' folks, we plant gardens an' more'n gardens, we plant the seeds of love, real true love—wonderful an' grand as things are there is nothin' this ol' world of ours quite so fine as love. Oh yes I'm gettin' long in years now—mebbe too old to think 'bout love an' such—but dear friends, every year of my life jest makes me think more of it—not jest the young, passionate love of youth but the long, lastin' love of age. Not jest the love of a boy for his sweetheart, but the real love of a man for his fellow men an' for the world. For all that is finest an' best in life—dear young friends, we never get too old for that kind of love.

Oh yes I like our young women—who doesn't? I don't love the bobbed hair, an' say now girls, I want to tell you somethin'. A few years ago an automobile attracted quite a lot of attention, but now a horse and buggy like we had when we wuz young, attracts more attention than any kind of automobile. So it was with bobbed hair; at first we stopped an' looked the second time, dear friends of the she sex, now we stop an' take a second an' mebbe the third or fourth look at a woman with nice long hair,—hair 'at makes her look like a woman, the kind of women 'at every man likes. The glory of woman is her hair. When she cuts it off she cuts off lots of the glory—yes I'll say she does. Cordially yours.—UNCLE RUBE.

FARMERS HURT MARKET BY STORING BEANS AT ELEVATOR

(Continued from Page 4)

farmer with the stored beans and he will probably sell out and enable the short seller to get the profit.

The farmers have the present situation partially in their own hands. If you make a survey of the storage bean situation and it developes as we think it will that the great bulk of beans estimated left in Michigan belong to the farmer and the farmer will sit tight and not sell them it might be the means of helping the market.

The present season starts out more unfavorable than a normal season. Should the weather remain cold and a heavy frost occur around the 10th of June it might result in serious damage to the early planted beans and this together with a decreased bean acreage in the sugar beet growing sections might work out to the advantage of the owner of beans. The farmer who has held his beans until this time and offered $3.80 to $4.10 for them it would appear to us that if by sitting tight until later might help the market at least it would be worth a trial. The short seller of beans might be able to bear the market lower but not as easily as when farmers are selling freely. If the bears did succeed in pounding the market down and, if it did go 25c lower which in our opinion is not probable if the farmer will sit tight—he could help better his own condition and we are sure there are dealers in the state who, would welcome any assistance that the growers might give them that would strengthen the market at least to a reasonable price and get it out of bear control.

Last Friday morning one of our brokers wired us that their broker competitors were soliciting business at $4.50 per cwt. delivered on fancy screened beans in a city that takes a freight rate of 37c from Midland. We told him to buy them as we could not afford to sell that cheap. Figure it out yourself. That price would leave $4.13 for the beans, deduct 12c for the bags, deduct 6c for brokerage and the shipper gets $3.93 for beans that cost him $4.10 per cwt. There is not a farmer in Michigan who can not see that any elevator who sold beans on a margin of 16c cwt. but what in a very short time would be out of business. But the elevator who sold short stored beans could to keep the market down sell two or three cars at what looked like 16c cwt. margin if by so doing he could break the market 10c or 15c per cwt. on 25 cars previously sold short.

We appreciate that many farmers having stored beans will need some money before the new crop but selling the stored beans would not be necessary. Their banker would loan reasonable amounts on storage receipts of reliable concerns and the banker would be quite sure the beans were on hand in the elevator before he loaned the money and if they were not on hand somebody would have to get busy and get them and that would not hurt the market any.

There is only one place to store beans that is on the farm and when beans come to the elevators they should be sold then the elevators who put their hard cash in them is not going out and try and bear the market on himself as can be done selling short stored beans owned by farmers in which the dealer has none of his own cash invested in them.

OH, MONEY! MONEY!

(Continued from Page 10.)

seemed interested only that Mr. Blaisdell, and especially Mrs. Blaisdell, should know the intimate history of one Ephraim Blaisdell, born in 1720, and his ten children and forty-nine grandchildren. He talked of various investments then, and of the weather. He talked of the Blaisdell's trip, and of the cost of railroad fares and hotel life. He talked—indeed, Mrs. Jane told her husband after he left that Mr. Smith had talked of everything under the sun, and that she nearly had a fit because she could not get one minute to herself to break in upon Mellicent and that horrid Gray fellow at the piano. She had not supposed Mr. Smith could talk like that. She had never remembered he was such a talker!

The young people had a tennis match on the school tennis court the next day. Mr. Smith told Miss Maggie that he thought he would drop around there. He said he liked very much to watch tennis games.

Miss Maggie said yes, that she liked to watch tennis games, too. If this was just a wee bit of a hint, it quite failed of its purpose, for Mr. Smith did not offer to take her with him. He changed the subject, indeed, so abruptly, that Miss Maggie bit her lips and flushed a little, throwing a swift glance into his apparently serene countenance.

Miss Maggie herself, in the afternoon, with an errand for an excuse, walked slowly by the tennis court. She saw Mr. Smith at once—but he did not seem at all interested in the playing. He had his back to the court, in fact. He was talking very animatedly with Mellicent Blaisdell. He was still talking with her—though on the opposite side of the court—when Miss Maggie went by again on her way home.

Miss Maggie frowned and said something just under her breath about "that child—flirting as usual!" Then she went on, walking very fast, and without another glance toward the tennis ground. But a little farther on Miss Maggie's step lagged perceptibly, and her head lose its proud poise. Miss Maggie, for a reason she could not have explained herself, was feeling suddenly odd, and weary, and very much alone.

To the image in the mirror as she took off her hat a few minutes later in her own hall, she said scornfully:

"Well, why shouldn't you feel old? You are old. You are old!" Miss Maggie had a habit of talking to herself in the mirror—but never before had she said anything like this to herself.

An hour later Mr. Smith came home to supper.

"Well, how did the game go?" queried Miss Maggie, without looking up from the stocking she was mending.

"Game? Go? Oh! Why, I don't remember who did win finally," he answered. Nor did it apparently occur to him that for one who was so greatly interested in tennis, he was curiously uninformed.

It did occur to Miss Maggie, however.

(Continued in June 21 issue.)

SIX CALVES IN ONE YEAR IS COW'S RECORD

HERE'S a record that would be hard to beat. Mert Smith of Bellevue, Michigan, owns a cow that gave birth to six calves in one year. Less than a year ago she presented Mr. Smith with a set of triplets, and two of the three are still living. Just the other day triplet heifer calves were born to her, and the three arrivals are reported to be doing nicely, all being perfectly formed.

THE HIDDEN FOE OF YOUR COMMUNITY

(Continued from Page 11)

are the pure in heart for they shall see God." Purity is the window of heaven to the soul, and we shut out the face of God when we close this window by pulling down the blind of obscenity and profanity. Now, this is an era of conservation of natural resources for the existence and comfort of the human family. This is fine. But now it is proposed that we spend a like energy in conserving the moral and spiritual health of our children by combating the hidden foe of impurity. To keep our boys and girls in the image of God, is to keep their minds unsullied and their bodies clean.

MEANING OF GENESIS 2:21

We are very well pleased with your sermons that we read in The Business Farmer. As I believe you are very well learned in the Bible, I would kindly ask you the meaning of Genesis, chapter two, and verse 21.—E. J., Curran, Mich.

THE creation accounts are not given to us in terms that satisfy the modern scientific mind. But does this story have to be scientifically accurate to be true? Certainly not, since the writer did not have this in mind. We must judge the truth of the account by the object the author has in view. In Genesis 2:21, the first object seems to be to set forth God's creative relation to woman thru the man. But, again it indicates the complimentary relation of man and woman. Cf 1Cor. 11:8, 9. In this scripture the author describes the process of creating the woman in language which he knew to convey, and in language which could be understood in that pre-scientific age. To instruct Little Bobbie we must use words he can understand. And tho the language of the verse in question is mysterious, the least advanced in learning may understand its creational and social significance. And this is why it is in the Book.—D. F. Warner, Religious Editor.

Because Health Comes First

"Grain them in summer? I should say I do. Not quite so much when there's pasture, of course, but they get LARRO every day in the year—if it's only a pound or two."

That's how they talk nowadays because they know health comes first—sleek, silky-coated, bright-eyed health—cows in tip-top, splendid condition.

Such cows are ready when it comes time to freshen and they have good, sturdy calves. They don't go off feed. They don't have udder trouble, lax appetites and indigestion. You don't pay big bills for medical treatment.

If your'e feeding LARRO you're feeding for health and profit. If you're feeding LARRO every day in the year—in spring, summer, fall and winter—you're feeding for the big, long profit.

All the care used in making LARRO—the safeguards against nails, wire and trash—the strict exclusion of all fillers and off-grade ingredients—the careful standardizing to get absolute uniformity in every particular—the exact proportioning of each ingredient—all these things have a two-fold object: health for your cows and the biggest possible profit for you.

There's a LARRO dealer near you. If you don't know where to find him, we'll be glad to have you write us.

DAIRY and LIVESTOCK

CLINTON FARMERS TO CONTINUE TO TEST

THE North Clinton County Cow Testing Association has successfully completed its first year. Operations began in March, 1923. After two changes of testers Mr. Ford Morgan of Kinde, Michigan, took up the cow testing duties. He completed the work successfully. Mr. Morgan closed the association year with a complete membership and the association, at a reorganization meeting held at Maple Rapids, April 16th, decided to continue the C. T. A. work for a second year. Twenty-two of the original members are continuing the work in this association and a few new members have been located in the neighborhood.—A. C. B.

VETERINARY DEPARTMENT

BOVINE TUBERCULOSIS

A friend of mine bought a registered Holstein cow at a public auction that had been tested a few days previous for T. B. by the state tester. In about 40 days after she was tested she died. We had her examined by a veterinarian who said her death was caused by T. B. He said if a cow is too far gone with T. B. she will not react. Is this true? Is there any redress? Will they have to pay for this cow?—A. H., Dryden, Mich.

IT is true that occasionally an animal is encountered which is so badly infected with tuberculosis that it will not react to the tuberculin test. This is due to the fact that the animal is saturated with tuberculosis material and will not respond to the irrigation produced by tuberculin when injected. Fortunately such animals are not numerous and can usually be eliminated by physical examination. And further, if such an animal has been in the herd for any length of time, there are almost sure to be other animals infected as the result of association. Numerous slight lesions in a herd, without any good explanation as to cause, usually leads to an investigation which would reveal a spreader if present.

In the effort to eliminate tuberculosis more is necessary than the mere mechanical application of the tuberculin test. It should be kept in mind that in referring to the tuberculous animal that will not react to the test we are dealing with a rare exception and not with a rule. If the animal died as you indicate and was actually tuberculosis, there would be no redress. When a tuberculin test is applied, every effort is made to locate all of the tuberculous animals but tuberculin is not an immunizing agent and it cannot be foretold what may happen to an animal after the test is applied. Forty days is a short time in which to develop tuberculosis in an advanced stage but it is usually conceded that the disease is not heriditary and cases are on record of calves eight weeks old which have been condemned on account of generalized tuberculosis. It is also possible that the animal in question may have been exposed or even infected before the test was applied but the disease had not developed sufficiently at the time of test to cause a reaction.

There are other conditions which may resemble tuberculosis and the veterinarian who made this examination should have confirmed his diagnosis by submitting material to a laboratory for examination. In any case where there is a question as to the accuracy of the tuberculin test, this should always be done.

The question of who shall pay for the cow would depend upon the arrangement or agreement at the time of purchase. If the purchaser was not absolutely sure of the health status of the animal or the herd from which it came, he should have asked for a 60 day retest privilege. Practically all pure bred owners who purchase valuable animals now specify that a satisfactory retest must be passed at the expiration of 60 or 90 days.—B. J. Killham, State Veterinarian.

Prizes in 1924 Ton Litter Contest

THE Michigan Ton Litter Club announces the prizes to be awarded to the winners in this year's contest. Liberal contributions from the leading packing companies slaughtering hogs in Michigan and from swine registry associations make possible attractive awards for swine breeders and feeders who excell in raising large litters of pigs and in feeding them to an early market weight.

Cash was contributed by Hammond Standish, Parker Webb and Sullivan Packing Companies of Detroit and the Pontiac Packing Company of Pontiac to provide for a gold medal to every producer of a litter weighing one ton or more at age of 180 days, and cash prizes as follows:

$25.00 to producer of heaviest litter at age of 180 days; $20.00 to producer of 2nd heaviest litter at age of 180 days; $15.00 to producer of 3rd heaviest litter at age of 180 days; $10.00 to producer of 4th heaviest litter at age of 180 days; $5.00 to producer of 5th heaviest litter at age of 180 days.

The Detroit Packing Company offers one piece of choice bacon and 100 pounds high grade tankage to each producer of the five heaviest litters in the contest.

Newton Packing Company of Detroit offers a choice ham to each of the producers of the two heaviest litters and a piece of choice bacon to the producers of the 3rd and 4th heaviest litters.

The above prizes may be won by any Michigan farmer complying swines.

Special prizes offered by breed registry associations: By National Duroc Jersey Record Association:

$50.00 to producer of heaviest Duroc Jersey litter, and an extra $50.00 if heaviest of all breeds.

By American Duroc Jersey Association: Bronze Medal to producer of the Duroc litter making the ton mark, who matures and carries through to the 180 days the largest number in his litter.

By Chester White Record Association: $25.00 to producer of heaviest Chester White litter sired by a registered boar and produced by a registered dam; an additional $50 if heaviest litter of all breeds.

By the O. I. C. Swine Breeders Association: $25.00 to producer of heaviest litter from a registered O. I. C. sire and dam, and an extra $25.00 if heaviest of all breeds.

By the Hampshire Swine Record Association: Large silver loving cup to producer of heaviest litter, all breeds competing, provided that the litter is sired by a pure bred Hampshire boar.

In order to qualify for the cash prizes, a good picture of the litter must be obtained near the end of the contest. The prizes will be awarded at the Michigan Swine Breeders Association meeting held during "Farmers' Week" at the Michigan Agricultural College.

Sixteen men won gold medals by producing more than a ton of pork from one sow in six months last year in Michigan. Although market values have discouraged many swine feeders, it is believed that fully as many growers will prove the efficiency of their strain of breeding stock and their system of feeding by producing ton litters this year. Raising large litters produces pigs at low cost per pig and rapid gains are nearly always relatively cheap gains. Ton litters usually demonstrate the best systems of management and are of interest to both breeders and market pork producers.

FREE BOOK ABOUT CANCER
The Indianapolis Cancer Hospital, Indianapolis, Indiana, has published a booklet which gives interesting facts about the cause of Cancer, also tells what to do for pain, bleeding, odor, etc. A valuable guide in the management of any case. Write for it today, mentioning this paper. (Adv.

CHICKS

INVESTIGATE

Our chicks are the kind that make good. Every flock is carefully culled and mated. FERTILE EGGS CAUSE LOSS TO FARMERS EVERY SUMMER

A LARGE part of the loss caused by eggs spoiling in warm weather can be prevented by producing only infertile eggs during the late spring and summer. This loss, which is conservatively estimated at more than $15,000,000 a year, falls almost entirely on the producer. Not only does he lose the value of the eggs which spoil, but the producer suffers a further material loss in the reduction of the number of eggs consumed caused by people getting bad eggs among those they purchase.

This loss can be entirely prevented by producing infertile eggs during warm weather. This is accomplished by taking all male birds out of the flock after the breeding season is over. The rooster has no influence on the number of eggs produced, and should either be marketed or killed—the meat can be canned—or he should be kept penned up.

TURKEY PRODUCES SOFT-SHELL EGG

I have pure bred Bourbon Red turkeys and one nice large hen seems to be and acts all right, only she lays a long flat egg, soft shelled. Four of them were open when she left the nest. After she leaves the nest she stands with her wings to the ground for a half day, after that she seems all right. She has only laid six eggs. Sits on the nest several times but fails to lay any more. She is tame. They have gravel all around, oyster shells I keep out by the water dishes. I thought you would know what to give my hen in this condition.—Mrs. R. N., Freeport, Michigan.

UNDOUBTEDLY this turkey hen has developed some internal disturbances affecting the reproductive organs, more especially the oviduct. The oviduct is not functioning properly, otherwise a normal egg would be produced. this trouble is frequently caused by an over fat condition which may result from corn feeding during the winter months. Some turkey hens are more disposed to take on fat and require careful feeding in order to avoid this condition.

Free range and exercise with limited grain feeding should gradually correct this condition. A dry mash consisting of wheat, corn, oats, with ten per cent meat scrap could be fed in an open hopper available at all times. There is less danger of stock becoming over fed on the dry mash method of feeding than where heavy grain feeding is practiced.

The expulsion of the soft shelled egg would be a severe nervous and physical strain on the turkey hen which would account for the fact she stands with wings drooping, for several hours after the egg is produced. A teaspoonful of castor oil if given at intervals of two or three days may assist in correcting this trouble.—E. C. Foreman, Prof. of Poultry Husbandry, M. A. C.

Average sale prices of purebred dairy cattle for the year ending December 31, 1923, ranged from $133 for bulls under one year to $268 for bulls over three years of age, according to reports submitted by breeders to the United States Department of Agriculture. The breeds included were: Ayrshire, Guernsey, Holstein, Jersey, and Brown Swiss. More than twice as many animals were disposed of at private sale as were sold at auction. Auction prices, however, averaged from $25 to $50 per head higher than those realized in private sales. Aged bulls were an exception, such animals bringing more in private sales than at auction.

New on the Wire

He was newly arrived in this country and was none too familiar with the use of the telephone. So he took the receiver and demanded:

"Aye vant to talk to my wife."

Central's voice came back sweetly: "Number, please?"

"Oh," he replied, perfectly willing to help out, "she bane my second vun."

Too Cool

"Tell me," said the lady to the old soldier, "were you cool in battle?"

"Cool?" said the truthful veteran, "why I fairly shivered."—Christian Register.

Could He?

"Well, doctor, do you think it anything serious?"

"Oh, not at all, it is merely a boil on the back of your neck, but I would advise you to keep an eye on it."

CHICK FEEDING

"A LACK of grit of the right size for baby chicks will oftentimes cause indications of leg weakness and anemia, and in some cases a condition which looks like roup," says Mrs. George R. Shoup, poultry specialist of the west Washington experiment station.

"When preparing grit for small chicks one should be careful to see that it contains a large percentage of grains the size of pin heads and larger. This, of course, applies to chicks up to the age of three weeks. After that age it can be coarser, perhaps one-half the size of a grain of wheat. When chicks run with the hen they usually get enough grit unless they are on clay soil. When they are being raised by artificial means they should be supplied with grit where they will have it handy.

"The question often comes to us about the feeding of infertile eggs," continued Mrs. Shoup. "Some people wonder if there is danger from white diarrhea, but our experience does not show any trouble of this kind developing if the eggs are properly boiled. An Ohio bulletin gives the results of experiments which shows that boiling for one-half an hour will destroy all bacteria.

"After boiling, the eggs can be run through an ordinary meat grinder, shells and all, mixed at the rate of 20 or 30 per cent by weight with dry mash. A feed of this kind supplies the necessary amount of protein and vitamines as well as minerals. It is essential, however, to feed some form of greens during the chick's every life, especially when they are not getting outside range. This can be done by the use of lawn clippings, chopped kale or sprouted wheat.

"Perhaps the most convenient plan is to sow wheat in boxes or a long trough along one side of the brooder room, which is covered with one-inch wire mesh. By sowing several days before the chicks are hatched the wheat will be green when it is needed. The first few feedings will need to be cut and placed before the chicks. After about 10 days, however, the chicks will jump onto the netting and eat the wheat as it grows through the wire.

"Wheat can even be sprouted in an ordinary sprouter by spreading it out only two inches deep in the trays. It then can be cut two or three times in one season.

"Bread crumbs can be supplied by saving all scraps from the family table or the bread box and placing in pans to dry out in the oven. They should not be baked, but just left long enough to be crisp and slightly brown. The pieces can then be run through the meat grinder with very little trouble. This makes a very high-quality feed which is relished by the chicks.

"Some people prefer to grind a few crusts in this manner immediately after they have ground the infertile eggs, as this process will clean the meat grinder in fine shape."

POULTRY HOUSE PAID FOR BY WELL CULLED FLOCK

THE results obtained by Mrs. F. L. Kruse of Clinton County, Iowa, through poultry culling under the direction of the county extension agent should be an encouragement to any one who may have hesitated to cull the home flock to get rid of "boarder" hens.

In July, 1921, when Mrs. Kruse had 210 hens, she called in the extension agent and with her assistance took out 80 "loafers," which were sold while the price was good. A number of neighbors attended the culling demonstration. The egg production was not cut down after the culling. The culls were watched for 4 days, but laid no eggs.

Mrs. Kruse kept a record of eggs produced and sold during the year, but did not include those used in the home, which amounted to a good many dozens. The flock has more than paid for a new poultry house built last fall from plans furnished by the extension agent. Eggs sold during the year brought $477.59, the old hens sold for $77.80. Several cockerels were cold for breeding purposes, and the rest were marketed while young, bringing in considerable additional money.

Importance of Growing Alfalfa in Michigan

(Continued from Page 4)

alfalfa seed on a field that was planted to a mixture, of alfalfas most of which had winter killed. In a few places on the Thumb and other localities, local farmers are depending upon alfalfa in the same way as other farmers depend upon clover. They raise their own seed and sow it in regular farm practice. This is the most hopeful sign of the times that I know, and will eventually place alfalfa on the Michigan map on the same basis as other crops. When all our farmers can go to their neighbors for seed, they can then depend upon getting a variety that has already succeeded under their climate and conditions. That is, when enough alfalfa seed is produced in Michigan to satisfy the needs of the state, the alfalfa industry will be on a sound basis.

When that time comes it appears to me that June clover will be crowded to the wall. One hay year and perhaps a little pasture is all that can be obtained from the ordinary red clover. Whereas real acclimated alfalfa is good for just as many hay years as the farmer desires. Clover and alfalfa hay take a large amount of lime out of the soil, and with larger yields of alfalfa the farmer will need to put on more lime. But lime is cheap plant food. Some farmers have been trying to grow clover without this food and have "worn out their land growing clover." Such land will not be suited to grow alfalfa until the lime is supplied. We note that the alfalfa which succeeds under Michigan conditions is getting more and more pedigreed. It is being more highly bred year by year.

What is a pedigreed, that is an improved variety? It is what we have said it is in the case of oats and barley. It is a variety that is able to produce greater yields or better quality under the same conditions. Any farmer knows that a good milch cow can not produce her best unless she has proper food and in large enough quantities. Neither can an improved alfalfa, clover or other farm crop produce its best without the proper plant food supplied in large enough quantities. Alfalfa breeding at M. A. C. has been going on since 1906. Thousands of individual alfalfa plants were set out from 104 different sources of seed during the season of 1907 and 1908. The plants in that nursery were in hills two feet apart each way. One does not realize how large individual alfalfa plants will become until he gives them a chance to develop. Within three years a good alfalfa plant will cover a piece of ground two feet in diameter if given all the space it can use. There are enough seeds in a pound of alfalfa, so that if scattered over an acre, there will be five seeds on each square foot. It probably takes five seeds for each sure plant. Some seeds will fail to germinate and many plants will die in infancy. Thus five pounds of seed per acre should if properly planted, place five plants on each square foot. That is better than more plants even for hay production, and is far too thick for seed production. Just think of placing five plants on each square foot, when a good plant could in three years cover four square feet! What chance do you suppose the individual plants have to produce seed? None.

This of course, is on the assumption that all the plants are hardy and each is capable of production. Listen to the breeding story at M. A. C. Those 104 different sources of seed included only one or two lots, from the Northwest. One of these was Grimm. More than half of the plants in that nursery were winter killed within two years, and perhaps a half of the remainder died of crown rots during the summer. Individual yields of hay and seed were taken with the survivers. The result was that only nine plants produced enough seed in 1908 to set out a progeny nursery in 1909 and none of these lines have survived up to the present time. In 1911 I was fortunate enough to obtain pedigreed strains of alfalfa from alfalfa breeders in the West. One of these original foundation stocks was picked up by Professor Wheeler near Baltic, South Dakota, and sent to Mr. P. K. Blinn of the Colorado Experiment Station. Mr. Blinn sent me some of the seed that he grew in Colorado. The 1909 and 1911 nurseries were heavily thinned by winter and summer killing but our attention was attracted toward a number of individual plants in the 1911 nursery coming from the Western sources. A new nursery was set out in 1913. One of the 1911 plants coming from the lot that Professor Wheeler obtained in South Dakota proved to be exceptional as seen by its progeny in the 1913 nursery. Its progeny was able to set leaves back on the old stems after the leaf-spot disease had taken the leaves off the nursery. The off-spring of this individual plant was distributed in 1919 under the name of the Hardy Michigan Alfalfa. Some one reduced this name to Hardigan and this is the name under which it goes at the present time.

Mr. Olef Nelson of Aloha, Michigan (produced 6½ bushels of Hardigan seed on an acre in 1921 and the following year five acres of new planting were drilled on his farm, the balance being sold to other farmers. Both of these plantings were in drill rows 28 inches apart and cultivated. His success no doubt is because he had light land.

The expansion of Hardigan would have been greater had it not been for the Hubam clover. At least one man, Mr. L. L. Lawrence of Decatur, Michigan, who had a Hardigan seed crop in 1921 allowed the seed to shatter off on the ground while he was taking care of his Hubam crop.

According to the hay yields obtained from several sources of seed, the Hardigan alfalfa has proven itself a better hay producer, as well as a much better seed producer under Michigan conditions, than the common sorts even including the Grimm. Michigan farmers who desire to try alfalfa seed production will do well to obtain some of the registered seed from the Michigan Crop Improvement Association.

However, the 1923 crop of Hardigan is entirely sold out at the present time, and new seed producers must wait until another crop of seed can be produced.

Community Inka Queen DeKol, a purebred Holstein, owned by Dr. T. C. Tiedebohl of Coloma, Mich., was high cow in the 1923 Cow testing Association Work in Michigan. Her record was 23,141 pounds of milk and 869.8 pounds of fat. She is 6 years old. Many fine records are established through the testing associations and members are boosting the work.

MARKET FLASHES

MARKET SUMMARY

Wheat weak. Corn and oats unchanged. Rye quiet. Beans firm. Eggs higher. Butter wanted. Old potatoes firm after recent advance. Good supply of poultry and prices lower. Dressed calves firm.. Cattle dull to steady. Sheep lower. Hogs active and higher.

(Note: The above summarized information was received AFTER the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press —Editor.)

FOOTE'S MARKET LETTER

BY W. W. FOOTE

Busy Times on Farms

PLANTING started in southern parts of the country weeks ago and has been working its way northward as fast as weather conditions would permit, much remaining to be done. The spring is late, and cold and wet weather caused serious delays while in many parts of the southwest lact of rains caused apprehensions concerning the winter wheat crop, but welcome rains came later and helped out the situation. To a very great extent the influences of grain statistics have lost their force in making prices, and attention is centered largely on the crop outlook. Plenty of grain for all requirements is offered on the markets of the country, and farmers are overdoing it in marketing their hogs, causing a lower scale of prices, but recent marketings of fed western lambs and spring lambs have been on a small scale most of the time, with a later increased movement. First arrivals of Idaho spring lambs in Chicago this year are chronicled, the opening of the season being an interesting event for sheepmen. The band consisted of 538 extra fancy handy weights, averaging 68 pounds, and they brought $17.15 per 100 pounds. The outlook favors spring lambs, provided they are prime in quality, but killers have little use for others, and they are sure to sell at a big discount. Conditions in the hog trade have changed much, with increased marketings just at a period when things were beginning to look brighter, and prices naturally declined. Cattle prices have had their ups and downs, with sales of the best lots at much lower prices than several weeks ago.

Our Export Trade

American exports of manufacturers ready for consumption increased nearly $20,000,000 in April, over the corresponding month last year, according to the commerce department. Exports of crude foodstuffs fell off from $17,736,000 in April, 1923, to $13,336,000 last month. Manufacturers ready for consumption exported were valued at $147,574,000, against $128,493,000 for April, 1923. Total American exports were $346,859,000, against $325,492,000 the same month a year ago.

Rapid Farm Development

One of the chief obstacles to profitable farming in this country arises from opening up of large tracts faster than increased agricultural products are required to meet the needs of the people and the wants of foreign buyers. The federal government and state governments have always been prompt to encourage the opening up and settlement of more lands, and this has in many instances worked out unfavorably by causing overproduction and unsatisfactorily low prices.

Features of Wheat Trade

For a long period corn was the leader in the speculative trading on the Chicago Board of Trade and the produce exchanges of the United States, but within a short time wheat has taken the lead, and it shows signs of continuing so. Crop news is very closely watched, and prices have advanced on reports of lack of rains and declined when the wheat areas had fair rainfalls. Very fair exports of wheat and flour have been made from North America in recent weeks, but the principal shipments to foreign countries consisted of Manitoba wheat. At times the milling demand for cash wheat has shown more animation, and the visible wheat supply in this country has kept on decreasing steadily, although more in sight than a year ago. Unusual interest is manifested everywhere in the crop outlook, but harvest time is a good way off, and about all that can be known definitely is that all reliable reports are that the acreage is much lowered from that of last year, while crop conditions look somewhat improved of late. There has been a phenomenal movement in Canadian wheat, and a short time ago it was announced that the Canadian visible wheat stocks had been reduced of late nearly 30,000,000 bushels. No marked improvement has taken place in wheat prices, and quotations are far lower than in recent years, May wheat having sold in the Chicago market a little more than two years ago as high as $1.38½. Late sales were made on the Chicago Board of Trade of May wheat at $1.05½, comparing with $1.21 a year ago.

Corn, Oats and Rye Markets

Recent weakness has been developed in the corn market, with speculators at times quite bearish and it seemed evident that traders were counting upon much larger receipts of corn in the near future, as has been customary in other early summers. Prices have undergone very large declines from the high time of a year ago, but a little more than two years ago sales were made in the Chicago market for May delivery as low as 60 cents, while at the same time May oats sold as low as 36½ cents. There is no heavy export movement in corn, oats or rye most of the time, although at times exports of rye make a fair showing, prices for this grain being singularly low. After corn planting is over much increased marketing of that cereal is expected, and in the meanwhile greatly lessened consumption of corn on farms is sure to take place, as pasturage is now satisfactory everywhere. Furthermore, there are reported to be 5 per cent less cattle and 11 per cent less brood sows on feed and on farms than a year ago. Late sales were made of May corn at 78 cents, comparing with 82½ cents a year ago; May oats at 46 cents, comparing with 41 cents last year; and May rye at 67 cents, comparing with 69⅞ cents a year ago.

The Cattle Market

During recent weeks the demand for prime beeves has not been large enough to maintain the extreme prices paid in the Chicago market several weeks ago, at which time the best long fed steers sold as high as $12.50 per 100 pounds. Price fluctuations have been much greater in the middling to good steers than in the commoner light weight yearlings, prices for the latter being strengthened by the good demand for desirable thin stockers and feeders to ship to feeding districts. One unsatisfactory feature of the cattle market of long standing continues, that of a glutted Monday market, with consequent slumps in prices on that day, and on the opening day of last week prices for steers fell 15 to 25 cents on arrivals of 22,073 head, with the highest sale at $11.30. The bulk of the sales of beef steers recently took place at $8.50 to $10.75, with the best offerings of long fed, weighty steers selling at $10.50 to $11.50 and a limited number of long yearlings up to $10.75. No good steers went below $9, and sales all the way down to $6.75 to $7.75 for the commoner light steers and inferior little steers selling for $4.50 to $6.70. Butcher cows and heifers had an outlet at $4 to $9.50, canner and cutter cows at $2 to $4 and bulls at $3.50 to $7.75. The calf market was lower at $5 to $10. The stocker and feeder trade was animated, the demand running on fair to prime lots, with sales largely at $6.25 to $8.60 and choicer feeders at $8.75 to $10. One sale was made of eleven car loads of Montana feeding steers averaging from 973 to 1257 pounds at $8.10 to $9.80. These steers were mostly choice Shorthorns that had been fed on hay all winter and on ground barley and wheat for the last 75 days. For the year to late date the aggregate receipts of cattle in twenty markets aggregated 5,041,000 head, comparing with 5,023,000 one year ago and 4,698,000 two years ago. A year ago common to prime beef steers sold at $7.25 to $10.90, and nine years ago at $7.10 to $9.50.

Large Hog Movement

Recent liberal numbers of hogs in the Chicago market resulted in a lower scale of prices for everything offered and especially for the fast increasing runs of the commoner class of light weights. As usual, the Monday supply was excessive, causing a break of 10 cents, the receipts aggregating 60,000 hogs. Later in the week the buying was especially good, with large purchases by eastern shippers. This is a time when large runs are expected, and it was a little more than a year ago when a day's arrivals on the Chicago market footed up 74,491 hogs, the largest on record for May. Recent receipts averaged 237 pounds, equaling the highest since last October and the same as a year ago. There has been a marked widening out in the range of prices, and the bulk of the hogs sell at a spread of 40 cents, with the best heavy butchers at the top, these selling 15 cents above the best light bacon hogs. Combined receipts in twenty markets this year amount to 19,042,000 hogs, comparing with 18,211,000 a year ago and 13,875,000 two years ago. A year ago hogs sold for $5.75 to $7.30. Recent sales of hogs were made at $6.40 to $7.50.

Enormous Provision Exports

More meat was exported from the United States in 1923 than in any other year since 1920—1,037,000,000 pounds, valued at approximately 150 million dollars. This figure does not include lard. Notwithstanding the drop in prices owing to the 30 per cent increase in quantity exported, the total value in 1923 was 11 per cent higher than in 1922, according to an analysis of world trade in 1923 by the Foreign Commerce Department of the Chamber of commerce of the United States.

Marketing Idaho Spring Lambs

The season for marketing Idaho spring lambs has opened with some good sized consignments which averaged well in quality and found ready buyers at advancing prices in the Chicago market. Shorn lambs sold off sharply, with transactions at $11 to $15, wooled lots of sheep and lambs selling $1 to $2 above quotations for clipped. Shorn yearlings sold at $11 to $13, shorn wethers at $6.25 to $10, shorn ewes at $5 to $7.25 and clipped bucks at $3.50 to $4.50. Spring lambs sell at $12.50 to $17.45, Idaho at the top.

BEANS

There is little change in the bean market although there is a feeling that prices are too low and the Detroit market advanced 5 cents last week. Some of the dealers have enough faith in the future of the market to hold a good supply believing that prices are sure to advance to a better level. So far receipts have been too liberal and demand too quiet to enable sellers to advance prices. Do not miss the article about beans on page 4 of this issue by Art Goulet.

POTATOES

An active demand prevails in the Detroit potato market and both old and new stock are higher in price. At New York and other eastern markets new stock is selling at good prices but old potatoes are dull. A steady tone is noted at Chicago.

HAY

Good hay is scarce and the markets are strong on this class of stock under an active demand. The bulk of offerings are of medium and low qualities and although this hay is not generally desired, buyers are forced to take it owing to the shortage of good grades. Trade as a whole is narrow, and although receipts are light, they are sufficient to satisfy trade requirements except as to quality.

MARKET QUOTATIONS

Wheat

Detroit—Cash No. 2 red, $1.12; No. 2 white, $1.14; No. 2 mixed, $1.13.

PRITCHARD'S
WEATHER
FORECAST
INTERPRETED BY THE STARS

Week of June 8

THIS week in Michigan will average warmer and drier than the seasonal normal. The week opens with pleasant weather but will become overcast and threatening during Monday and Tuesday. Local thunder showers may be expected at this time. For the remainder of the week, or until about Saturday, the weather will again become pleasant, hazy and summerlike.

Beginning at the end of this and running into the beginning of next week the weather in this state will become more unsettled with a little more rain and strong winds.

Week of June 15

Rain and wind will be more or less general in Michigan during first part of this week. By the middle part of the week, the sky will have cleared off and several days of pleasant weather will follow. However, the temperatures during the night will generally remain cool for the season. About Saturday storm conditions will again be in evidence in the state and the week goes out with showers and thunder storms general.

First Real Hot Weather in August

From about 23d to 24th of June a sharp reaction to warmer will generate some severe electrical and wind storms and moderately heavy rains, especially in local centers.

Following the storm center during middle part of the last full week of June, temperatures will again show a falling tendency that will continue until early part of July.

The real hot weather of the year, however, will not begin until early part of August.

ALLOWING FORESTRY THROUGH SUITABLE TAXATION

(Continued from page 3.)

taxation of farm woodlots and commercial timber tracts has been conceeded by all to be a very important but most perplexing problem, and especially so in Michigan where there is such a large acreage which should logically be used for timber production.

Farm Woodlots Important

Now farm woodlots are an important part of American agricultural interests. The woodland now included in our farms totals more acres than all the state and national forests. One-third of the forest-growing lands of the United States is at the farmer's back door. In ten, twenty, ofttimes one-hundred acre tracts and more, they form part and parcel of practically every farm unit in the United States.

In Michigan at present only about 4,000,000 acres of virgin timber in the hands of the lumbermen remain to be cut, while census figures indicated that over 3,000,000 acres are devoted to farm woodlands.

Out of the state's 36,000,000 acres, nearly a third are idle and non-productive. If this land is to be reforested and used for timber production, the farm must have the assurance that the taxes will not be confiscatory and force him to harvest his timber before it is really ready for marketing. With such assurance, commercial reforestation appears to be a safe and attractive proposition.

Timber Market Looks Strong

During the last 80 years, the price of lumber has advanced three and a half times as fast as the average price of all staple commodities and there is every reason to believe that the market for forest products will continue to be very strong—in fact, grow better year by year. For as Louis Lamb points out in an article in Commerce and Finance:

"Virgin forests in the United States once covered 822,000,000 acres, more than a million square miles. There remains 137,000 000 acres, less than one sixth of the original. Towns and farms have filled nearly half the cleared spaces; the remainder is either idle land or bears inferior quality second growth timber. We consume 25,000,000,000 cubic feet of timber yearly, only one-fourth of which is being replaced by new growth.

"The decade of 1880-1890 saw 45,000,000,000 feet of white pine cut and sold in Michigan alone. By 1895 the cream of the Michigan stand was gone and Wisconsin was on the way to the "cut out" stage.

"We have left about 2,215,000,000,000 of standing saw timber in the United States, about one-fifth of the inheritance received from primeval nature, by the colonists of 1620 and 1688."

Big Demand for Timber

So far has this program of forest depletion been carried on that 28 states now import more lumber than they produce while many of the eastern states which formerly were large exporters now are large importers. Secretary of Agriculture Wallace announced at a recent hearing before the Senate Committee on Reforestation.

This situation is very true in regard to Michigan. $15,000,000 is spent annually for freight on lumber imported into Michigan. This proves conclusively that timber production in our state is falling far behind our own domestic requirements, and the situation is steadily growing worse. At present rates of lumbering, some twenty years will see the commercial hardwood forests of Upper Michigan exhausted as the pine forests are already exhausted.

Saginaw at one time cut 600,000,000 to 700,000,000 feet of pine per year. Yet when Ex-Congressman J. W. Fordney recently built a splendid new barn he ordered three cars of lumber and a carload of shingles from Aberdeen, Washington, within sixteen miles of the Pacific Ocean.

Tax Reform May Be Solution

So the future looks bright for timber production, but as already pointed out, there is little hope of commercial reforestation as long as the general property tax takes an annual toll while the growing timber is bringing in no return. To promote reforestation, therefore, some better taxation system is required.

Michigan already has a fairly good farm woodlot tax law, although it must be admitted that it is not very generally used by farmers. The law provides that out of a 160-acre farm of which 80 acres is cultivated, a tract of not more than 40 acres if kept well stocked with trees may become a "private forest reservation" and, having been listed with the county treasurer, is thereafter assessed and taxed at a valuation of $1 an acre plus a five per cent harvest tax on the stumpage value of any products harvested.

While this law takes care of the small farm woodlots, it does not apply in the least to commercial forests. Therefore, after an exhaustive study of the whole timberland taxation problem and a careful analysis of Michigan's forestry needs and opportunities, a representative committee of Michigan forestry experts drafted the act for the taxation of Michigan's commercial timberland which came so near being a law.

Theory of Forest Taxation

The proposed law was carefully drawn and was rather lengthy, but the heart of the whole matter is simple. It provided that timberland should be assessed at 5 cents per acre annually while the timber itself should be subject to a harvest tax at the time of cutting.

Now there doesn't seem to be anything radical about this. There is ample precedent for such a system. In fact, that is the way we tax farm crops. The farmer is taxed on his land and on the proceeds from the sale of his crops, but the crops themselves are not taxed before they are ready for market. In all justice a similar arrangement should be provided for the grower of timber crops.

Under the general property tax, at least in theory, a stand of eighty year old timber will have been taxed eighty times, and each time on the sum of its growth to date, so that the compounding of taxes and interest eats up all profits long before the timber is ready to cut. That, as remarked by the Chief of the United States Forest Service, is equivalent to taxing a field of growing wheat every few days through its whole growing season.

"When the states recognize by their tax laws", the U. S. Forestry Chief recently declared, "that those engaged in growing trees should not have a property tax imposed each year on the trees amounting in the end to confiscation, progress could be made in reforestation".

Farmers and owners of commercial timber tracts or lands suitable for reforestation should not cease their fight until a just and workable forest tax law is enacted. And in their effort they should have the support of all who wish to see Michigan reach its greatest possible development.

The relatively low price of slaughter hogs and comparatively high price of corn during 1923 apparently affected the price of purebred swine inasmuch as combined prices of all breeds of the latter were lower during 1923 than in 1922, according to reports from breeders to the United States Department of Agriculture.

A grocer called to collect his bill frequently, but without success. Finally he said in desperation:

"Mr. Jones, I must insist that you make some definite arrangement with me."

"Why, certainly," replied Mr. Jones, agreeably. "Lets see—well, suppose you call every Thursday morning?"

Customer: "I like this piece of checked goods, but are you sure the colors won't run?"

Clerk: "Madam, this is a certified check."

WHEN WRITING TO ADVERTISERS PLEASE MENTION THE MICHIGAN BUSINESS FARMER

Order Your Protective Service Sign Now

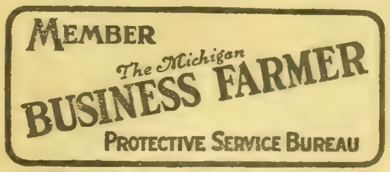
The Protective Service Bureau of The Business Farmer is now able to furnish its paid-in-advance subscribers a beautiful Protective Service Sign.

It is a high class sign in every respect, made up in two colors, red and black, on a white background, weather-proof, 5x11¾ inches in size, suitable for hanging on your fence, mail post, or other prominent place.

This sign will serve as a warning to crooks, fakirs, quacks, and grafters, to keep away from a farm which is affiliated with The Business Farmer Protective Service Bureau.

Only a few thousand of these signs have been ordered and we are going to mail them to our friends—first come—first served—at actual cost, only 25 cents. We already have had advance requests for hundreds of these signs—Fill in the coupon below, so as to be sure you get your sign before they are all gone.

THE BUSINESS FARMER,
Protective Service Bureau,
Mt. Clemens, Mich.,



5x11¾ inches Red and Black on White Background

( ) I enclose a dollar for a two year renewal and 25c for a Metal Sign and certificate.

Polarine
MADE IN FIVE GRADES
Polarine
THE PERFECT MOTOR OIL
STANDARD OIL CO.

Do You Buy—Lubrication or Merely Oil?

THE STANDARD OIL COMPANY (Indiana) sells you lubrication. It sells you absolute friction reduction worked out with scientific exactness.

When you buy Polarine you get, in addition to oil, the vast lubricating experience of the Standard Oil Company (Indiana)—you get the benefit of the accumulated scientific knowledge—both chemical and mechanical—which this experience has gathered.

You get the net result of hundreds of laboratory and field tests.

N. B.—For recommendations of grades of Polarine to use in automobiles and trucks consult chart at any Standard Oil Company (Indiana) station.

Use Polarine

THE PERFECT MOTOR OIL

Made in Five Grades

You reduce carbon to a minimum—you lengthen the life of your engine and bearings—you minimize repair bills—delays—and lost time.

All this you get when you purchase Polarine--well worth-while, isn't it?

Thousands of tractor and truck owners in the Middle West have proved that using Polarine is sound business. They are following the Chart at the left. Your tractor, also, is there.

Consult this chart and order a supply of the right grade of Polarine. Then, drain your crankcase frequently and refill with the right grade of Polarine.

Put lubrication on a business basis—it pays.

BUTTERFIELD MAY TALK AT STATE GRANGE MEET

OPPOSITION to a state income tax may be challenged to debate the issue at the convention of the Michigan State Grange to be held at Petoskey, Oct. 28 to 31, according to information received from officers of the Michigan State Grange. The Grange is active in supporting the income tax amendment to be voted on at the November election.

Dr. Kenyon L. Butterfield, president-elect of the Michigan Agricultural College probably will be one of the speakers at the convention. Dr. Butterfield formerly was editor of the State Grange paper and has been closely identified with this farm organization.

KETCHAM BILL FAILS TO PASS SENATE

THE Ketcham Bill, providing for extensions of agricultural foreign service and a codification of existing law relating to this work, failed to pass the Senate, although it was reached twice on the Senate Calendar. In both cases one or more Senators objected, and both cases occurred when the Senate was working under "Unanimous Consent" rules. The effort to secure this law was based on what appeared to be a self-evident effort of the Dept. of Commerce to secure in the Winslow Bill, a law which would give it sole jurisdiction over all agricultural agents in foreign countries, and wipe out the agricultural service abroad, except under the jurisdiction and control of the Secretary of Commerce. The Winslow Bill was fought to a standstill in the House and an effort to pass it under suspension of the rules was defeated. Senator Jones of Washington introduced the same measure in the Senate, but could not get it reported by the Senate Committee on Interstate and Foreign Commerce. However, the same influences which were back of this measure were able to defeat the Ketcham Bill. The Ketcham Bill was passed by the House, and will be on the Senate Calendar for passage in December, but in the meantime six months to a year of time is lost in reorganizing this service. There is no doubt of a determined effort in December to defeat the Ketcham Bill and pass the Winslow Bill in its place.

FOOT-AND-MOUTH DISEASE WANING

RECENT reports received by the Chief of the Bureau of Animal Industry in Washington show that the outbreak of foot-and-mouth disease in California is definitely on the wane. Accounts received from field headquarters up to June 10 showed no new cases of infection for four days, the longest period without new herds being reported since the beginning of the outbreak in February. Not only were there no new cases, but there were no condemned animals to be slaughtered. All infected premises have been cleaned and disinfected. So efficiently was the cleanup work carried on that no sooner was the disease discovered than crews were busy getting it under lime and earth. The situation now, says Dr. John R. Mohler, Chief of the Bureau of Animal Industry, is the most favorable yet reported. There will be no slowing up in the work of suppression and no relaxation in watchfulness until the plague is thoroughly eliminated and the country's livestock industry freed of all danger from this source.

237 GRADUATE FROM M. A. C.

THE 1924 graduating class at Michigan Agricultural College, number 237 students, is slightly smaller than the average number of graduates for the past few years but, satisfaction as to the condition of the school in this respect as compared with other land grant colleges is expressed by Miss Elida Yakeley, registrar of M. A. C.

The nation-wide depression in agriculture, while Michigan is one of the states suffering the least effects, according to state agricultural leaders, is reflected in the fact that the number of engineering graduates this year is greater than the number of agricultural graduates.

The engineering division leads in the number of graduates, with 71 students, while the home economics division with 64 and the agricultural division with 62 follow closely. Twenty forestry students, 14 in the applied science division, and six in the division of veterinary medicine complete the roster of graduates.

The success of the Applied Science division, which was established as the first non-technical branch of the college in 1921, is an indication of the effect which this division and the new Liberal Arts Course, which will be instituted at the beginning of the next school year, will have on the enrollment of the institute, in the belief of the college officials.

The class of 1924 is the first class to graduate from M. A. C. which has been practically free from the effect of war conditions. Last year's class included a number of students who had entered with earlier classes and dropped out of school to enroll in the army, returning to graduate with the class of 1923.

CROP CONDITIONS POOREST IN TWELVE YEARS

THE composite condition of all growing crops on June 1 was lower than on any corresponding date in more than twelve years, says the United States Department of Agriculture.

With the exception of some fruits and vegetables, no crops are up to the usual average for this time of year and the season thus far has been unusually unfavorable for corn, spring wheat, oats, barley and cotton. Pastures have been slow in starting and hay is showing less growth than usual. The country east of the Rocky Mountains has had the third coldest May in thirty years.

Dry weather has prevailed on the Pacific coast and May was hotter than any previous May in thirty-seven years. Crops in that part of the country are much poorer than usual, particularly in Washington where crops, including fruits, are expected to produce only two-thirds as much per acre as usual with the result that the purchasing power of local farmers seems certain to be seriously reduced.

Wheat growers in Kansas are also facing an unprofitable season, the department says. In other parts of the country the final showing depends too much on late planted crops and on summer weather to permit any degree of accurate estimate of the final outcome, but the department says that present prospects are for somewhat lower crop yields than usual in nearly all parts of the country except in some of the fruit sections of the Eastern States.

An optimistic note is sounded, however, in the statement that in some years when spring has been late, yields have been unexpectedly good. Corn and cotton are still being planted or replanted and many fields of oats have only just come up. With good weather the usual acreage of crops may still be grown and in the country as a whole the usual number of bushels and bales may be harvested, the department says.

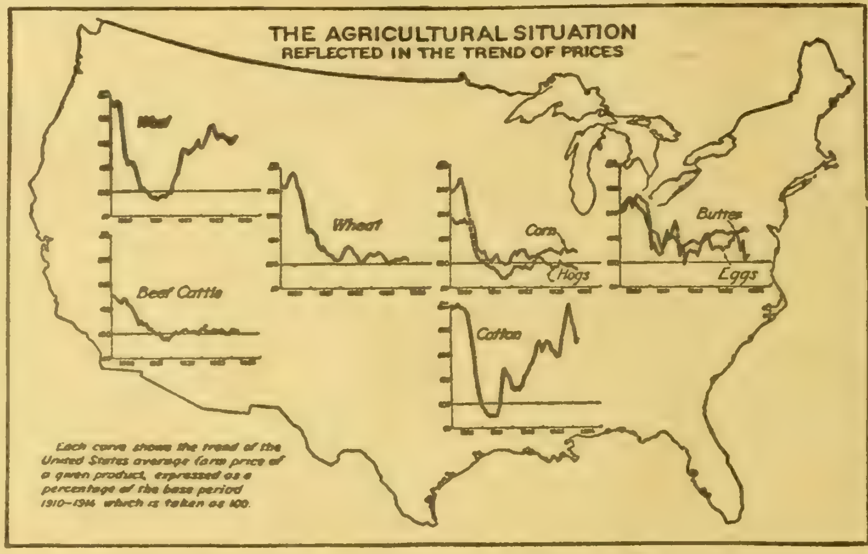
26 CO-OPERATIVE MARKETING BILLS PENDING

TWENTY-SIX co-operative marketing bills, or bills dealing with some phase of the co-operative marketing problem are pending, none of them being given a hearing in either House or Senate. Without a hearing the Senate Committee on Agriculture reported both the Smith Bill and the Curtis Bill. Late in the session Congressman Tincher introduced a bill which provides for voluntary government registration of co-operatives, examination of their financial accounts, increased work by the Department of Agriculture in establishing grades, standards, and inspection service. It is understood that co-operative organizations generally have made representations against action on any of the pending bills, until they can have time to examine them in detail, and to be heard for or against them. It is altogether likely that the first big task the House and Senate Agricultural Committees will take up in December, will be this problem and the pending measures relating to it.

STRAWBERRY PRODUCTION DECLINES

TWO million and a half fewer quarts of strawberries were eaten by Americans last year, than were consumed a quarter of a century ago, due to a decreased acreage rather than a decrease in the public appetite. The strawberry remains the most popular of all small fruits, but a scarcity of berry pickers has made profits uncertain, according to Samuel R. Guard, Director of the Sears- Roebuck Agricultural Foundation.

It is found that in the twenty-four years between 1899 and 1924, the strawberry acreage in the United States has been reduced 21 per cent. For the last two years, acreage figures have been considerably higher than during the previous five year period. This year the estimated acreage is again low, totaling only 113,250 acres, as compared with 119,395 acres in 1919; 143,045 acres in 1909, and 151,363 acres in 1899. Twenty-five years ago there were 257,427,000 quarts of strawberries produced. In 1909, the production had decreased to 255,702,000, and in 1919 to 176,932,000 quarts, a 30.8 per cent reduction in the twenty year period. Last year there were 254,691,000 quarts reported, which is a considerable increase over the 1919 crop figure, but more than two and a half million quarts under the crop of 1899. The crop forecast this year in the five second early states—Arkansas, North Carolina, South Carolina, Tennessee, and Virginia—which furnish most of the strawberry shipments of this season, is 83 million quarts, or about the same as a year ago. This is 20 per cent under the production figure of 1922, which was an unusually heavy crop year.



THE AGRICULTURAL SITUATION
REFLECTED IN THE TREND OF PRICES

Each curve shows the trend of the United States average farm price of a given product, expressed as a percentage of the base period 1910–1914 which is taken as 100.

Relative prices tell the story of optimism or depression. With urban prices and wages from 60 to 100 per cent above pre-war level, producers of beef cattle, wheat, hogs, or other products selling at or below pre-war prices, are at serious economic disadvantage. This chart shows at a glance why the Far West is favoring sheep over beef cattle: why the Wheat Belt favors less wheat and more dairying; why the Corn Belt is increasing corn and reducing hogs; why the South has increased cotton acreage.

The Big Summer Holstein Round-up

"EVERY summer, one big gathering of lovers of Holstein cattle," such is the plan of officials of the State Holstein Ass'n, Last year the large occasion was the "Round-up" at the farm of D. D. Aitken, of Flint.

This year the summer classic will be held at the farm of the Detroit Creamery Company at Mt. Clemens, on July First. This meeting will be under the joint auspices of the Macomb County Holstein Ass'n—the largest in the State—the State Holstein Ass'n, and the Detroit Creamery Company Farms. The program as arranged by these co-operating sponsors is as follows:

FORENOON—Meet at the Detroit Creamery Farms. This establishment is located one and one-half miles south of Mt. Clemens on Gratiot Avenue, or eighteen miles out of Detroit on Gratiot. Visitors will "get an eye full" as the Farms include 1800 acres, there are 24 silos, the milking herd numbers over 500, etc.

NOON—Picnic dinner at the Detroit Creamery Company Picnic Grove. Bring your "makings." The grove is well equipped with modern conveniences, water supply, tables, etc. Free ice cream will be furnished by the Macomb County Holstein Ass'n.

The feed will be followed by short, snappy talks by representatives of the National and local Holstein Associations. Prof O. E. Reed, Head of Dairy Dept., M. A. C. has been specially invited to talk.

AFTERNOON—Huge Judging Demonstration at the farm of the Detroit Creamery Company by Bob Haeger, National Holstein Judge.

"Home in Time to Milk."

Are you acquainted with Mr. Bob Heager? Just scan his pedigree. In the first place he is a breeder of Black and White cattle, having a herd of his own, numbering sixty head, at Algonquin, Illinois. Then, he is a veteran showman, having followed the fairs for years. His famous show cow Minerva Beets was five times Grand Champion Female at the National Dairy Show. Haeger also showed a bull Paul Calamo Korndyke who won Grand Champion Bull three times. These champions represent the last word, the top notch in showing of dairy cattle. No other Holstein ever won distinction more than once. To sum up Haeger's rating as a show man, it can be said that he has won more prizes, including nine Grand Championships, than any five other breeders combined. And, in addition, Bob is a nationally known judge of Holsteins, having officiated during the last four years at leading fairs thruout the U. S. He is booked now to handle Holstein judging at Michigan State Fair in 1924.

Judge Haeger will not be crippled in giving his demonstrations for lack of material as the large herd of the Detroit Creamery Company will yield specimen from every class of females, at least. There are approximately 125 head of purebred Holstein females on the Farms, as well as four mature service sires.

Everyone is invited to this big meeting. You don't have to own pure-bred Holsteins to be eligible; if you are interested in the dairy business you are welcome. Young breeders and boys and girls interested in Calf Club Work are especially urged to accept this opportunity to learn from an expert the fine points of judging Holsteins.—J. G. Hays, Sec. State Holstein Ass'n.

(Editor's Note: The Holstein association of Macomb county was organized through the efforts of County Agent Murphy, a real "live wire", and at a meeting held this spring it was decided to have a dairy meeting and picnic, and the day and place was decided at that time. A committee got in touch with the state Holstein association and the M. A. C. dairy department and it was then decided to make the annual "Round-up" a part of this meet. Mr. Murphy urges all who are interested in dairying, especially those in Macomb county to attend. And he has made a special appeal for the boys and girls interested in club work to be on hand. Let's make a day of it.)

SATURDAY

The Growing Menace of Tax Exempt Securities

By Purchasing Bonds Exempt From Taxation Idle Rich Eludes Tax Collector

By STANLEY M. POWELL

(Lansing Correspondent of The Business Farmer.)

IN concluding our recent article on fair assessment of property for tax purposes, we advocated the adoption of such taxation reform measures as would insure not only the more just appraisal of property, but would result in placing additional property, especially personal property, on the tax rolls. This method is beyond all doubt one of the easiest ways to reduce the tax rate and secure a more equitable distribution of the tax burden. When the tax rate goes down it has been the universal experience that personal property quite generally comes out of its hiding places and begins to turn in revenue to the government thus relieving the burden on real estate.

But in the consideration of this situation, we are immediately confronted with the fact that a large amount of tangible property is in the form of bonds and securities, which have been made in whole or in part tax-exempt.

The Vicious Circle

Now that the income tax idea is firmly established as a means of raising revenue for our national government and since the rate has been made progressive, that is higher for the larger incomes, it is proving true that these so-called tax-exempt securities are becoming more and more popular with the wealthy classes. This popularity increases the demand for this type of investment, which in turn stimulates the issuance of tax-exempt bonds and encourages municipal and governmental extravagance, and thus the vicious circle rolls on and on, while the man with the small income, the general property owner, carries the heavy burden of governmental support and the idle rich smugly and complacently elude the tax collector—with official sanction.

The enormous unfairness of this situation is rapidly becoming so apparent that popular opinion, backed up by the best thought of America's leading economists and statesmen, is clamoring insistently for reform to wipe out this flagrant injustice.

What Is the Remedy?

As the first step toward remedying this deplorable condition, Secretary of the Treasury Mellon recommended an amendment to the Constitution to prevent any further issuance of tax-exempt bonds by municipalities, but that was voted down by Congress. If it is a sound principle of taxation that "subjects of every state ought to contribute toward the support of the government as nearly as possible in proportion to their respective abilities," where is the justice in a situation which allows people of large means to actually escape taxation through the purchase of bonds bringing in a net yield of 4½ per cent to 4¾ per cent?

Can anything be more fantastic than the Government of the United States solemnly declaring its purpose to take fifty-eight per cent of a man's income and then provide the means whereby he will pay no tax at all? What is the sense of talking about the rich tax dodgers when the United States Government considerately provides isles of safety on which men of wealth can find complete security from state and federal taxes?

Former President Harding clearly saw the menace of tax exemption back in 1921 when he said in his message to Congress:

"Many of us belong to that school of thought which is hesitant about altering the fundamental law. I think our tax problems, the tendency of wealth to seek non-taxable investment, and the menacing increase of public debt—Federal, State and Municipal—all justify a proposal to change the Constitution so as to end the issue of non-taxable bonds. No action can guard against future encouragement of capital's paralysis, while a halt in the growth of public indebtedness would be beneficial throughout our whole land."

A Many-Headed Monster

Lemuel S. Hillman, writing in the February 15, 1924, issue of the Old National Bank Bulletin, published bi-weekly by the Old National Bank of Grand Rapids, says: "Tax-exempt municipal bonds are unsound and vicious because their effect on the present condition tends to produce the following four bad results:

"It deprives the treasury of revenue which it has a right to expect from men of large means.

"It shifts the burden of taxation to men of smaller financial circumstances.

"It hampers industry by diverting capital which under other circumstances would be invested in public utility, railroad and industrial enterprises.

"It encourages extravagant municipal financing."

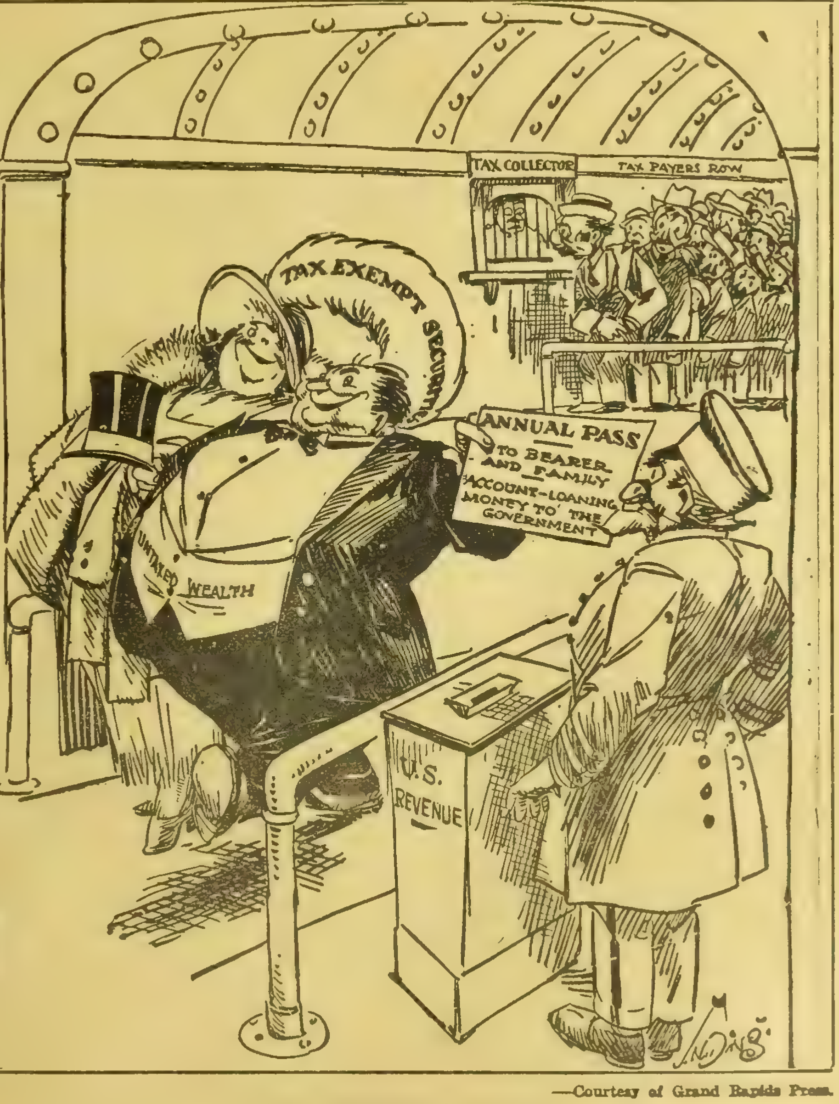
In order to realize the tremendous importance of this matter of tax-exempt securities and the very real menace which confronts our tax payers if this situation is not speedily remedied, let us examine a few figures which trace the development and present status of the tax-exemption evil.

No less an authority than Hon. Ogden L. Mills, Congressman from New York and member of the Committee on Ways and Means, addressing the recent meeting of the National Tax Association, declared:

"For every dollar expended in 1914 for household budgets, labor department figures show the expenditure in 1922 was $1.60, but for every dollar expended in governmental cost in 1914, the preliminary census figures indicate that $2.50 was spent in 1922. But this is not all. States and municipalities have been and are increasing their bonded indebtedness at an even greater rate, in many instances to cover current expenditures, and in more numerous cases for the purpose of financing improvements, whose life is only too frequently exceeded by that of the securities issued. State and municipal issues in 1913 amounted to 591 million dollars; in 1922 to 1 billion, 675 millions. In 1913, the securities outstanding amounted to 3 billions, 822 millions. Today they exceed 11 billions.* * *

Government's Loss Huge

"Tax-exempt securities constitute, in my judgement, the greatest evil in the whole field of taxation—an evil so farreaching in its consequences, both social and economic, as to be deserving of the most serious and immediate attention on the part of the people of the country. Of one thing I am perfectly sure: a progressive income tax at high rates and tax-exempt securities cannot exist side by side. Tax-exempt securities must inevitably destroy the progressive income tax, and I am by no means certain that the evil has not already reached such proportions as to make any possible action too late to save our present federal income tax. Tax-exempt securities, gentlemen, are absolutely indefensible, whether you study them from the standpoint of the fiscal needs of government, from the economic or from the social standpoint. Let us consider the fiscal problem first.



—Courtesy of Grand Rapids Press.

UNTO THEM THAT HATH.

"The Treasury estimates that there are $11,000,000,000 of wholly tax-exempt securities outstanding, and that they are being issued at the rate of $1,000,000,000 a year. There are, in addition, some $20,000,000,000 of partially exempt United States securities. If we assume that this $10,000,000,000, more or less, of wholly exempt securities and the $20,000,000,000, more or less, of partially exempt securities are held in the following percentages by the following classes, I can give you an estimate of what it is costing the Government.

"Assuming that 37 per cent of these securities are held by corporations, that 23 per cent are held by people who pay no income tax, and the balance by people whose average rate of income tax is 35 per cent, tax-exempt securities are today costing the United States Government $242,000,000 a year. * * *

"Theoretically, this loss should be offset by the lower rate of interest which the Government has to pay by reason of the tax-exempt privilege granted the investor, but this, under our system of government and taxation, is only true to a very limited extent. Thus the Federal Government derives no benefit whatsoever in so far as state and municipal securities are concerned. In the second place, even with respect to its own securities, it is unable to capitalize the reduced taxes, first; because the rate is uncertain; second; because it is progressive.

Here's How It Works

"There is no question but that if we had a flat, uniform and reasonably permanent tax, tax-exempt securities would command a price in the open market which, as compared with the price of taxable securities, would be higher in proportion to the exact extreme represented by the tax-exempt privilege; that is to say, they would sell at a price high enough so that the net yield of the bonds would be equal to the net yield of the taxable bond, after the payment of the tax. The Government would, of course, get the benefit of the increased value. But with the progressive rate we have a very different situation.

"Let us assume that a man with an income of $10,000 bought in 1920 a 5 per cent taxable bond which yielded him a net return of 4.58. Had he bought a tax-exempt bond and paid 105.17, it would have yielded him 4.58 net. In other words, he was equally well off whether he bought a taxable or a non-taxable security at that price. But assuming that the non-taxable security was selling at 106, then he was obviously better off if he bought a taxable security. This meant that under the 1918 Revenue Act the $10,000 man dropped out of the tax-exempt security market at 106.

"Apply the same line of reasoning to the other income classes, you will find the $20,000 man dropping out at the somewhat higher figure, and so on down the line. The million-dollar man could have afforded to pay 143.80 for the non-taxable as compared with the taxable 5 per cent bond. As a matter of fact, he obtained the non-taxable bond at a much lower figure, by reason of the fact that the other income classes dropped out long before the bond had reached a price where it would be

Simple Instructions on Dehorning the Calf

Art of Dehorning Simple and One Should Be That Way When He Approaches Matter, and Calf, Says Expert

By JIMMIE HAYES

Dairy Extension Specialist, M. A. C.

OF COURSE you know Jimmie Hayes, or have heard him talk at some meeting. If you have never heard or met him you have missed something. He knows live stock from A to Z and, in addition to being in the Dairy Extension department at the M. A. C., owns a farm known as "Komboss Farm". In this article, which appeared in the Holstein World, he tells how to dehorn a calf. If you do not know how to perform this "simple" operation we advise you to read this article carefully. And even if you have had experience with this "simple art" don't miss this article; you'll get some new ideas. The article is just as witty as his talks and if your sides do not ache before you get through it you better call a doctor.

ABOUT one year ago I struggled to my feet at a banquet telling my fellow Holstein breeders numerous valuable points about our noble calling. Among the regular gems trickling through my somewhat irregular teeth were a few remarks concerning the technique of dehorning a calf.

Some of my auditors (Is that the word I want, "auditors," or should it be "Creditors?" I am more familiar with the latter; anyway I mean them there folks what had to be polite and listen), said I should write your paper the formula or performance or whatever it was. So I resolved to do so and here, 10 months later, I get to the point just about the way we farmers do our writing, eh? Or transfer our Holsteins?

Today I had a special reminder to enlighten you as per aged resolve, when at a little gathering I was telling the dairy farmers how to lose money gracefully in the cow business, and during my harangue one certain person in the bunch would smile every time I caught his eye. I concluded I surely had a dairy convert in him. And when I momentarily subsided this person asked me a question. "What makes a cow's horns drop off?" Now I wonder was he a convert or was he like the cow's horns? Anyway his question reminded that I really should be writing you about how to dehorn a calf.

It is a very simple procedure. Each and every farm press article on the subject admits that it is simple. One should be that way when he approaches the matter, and the calf.

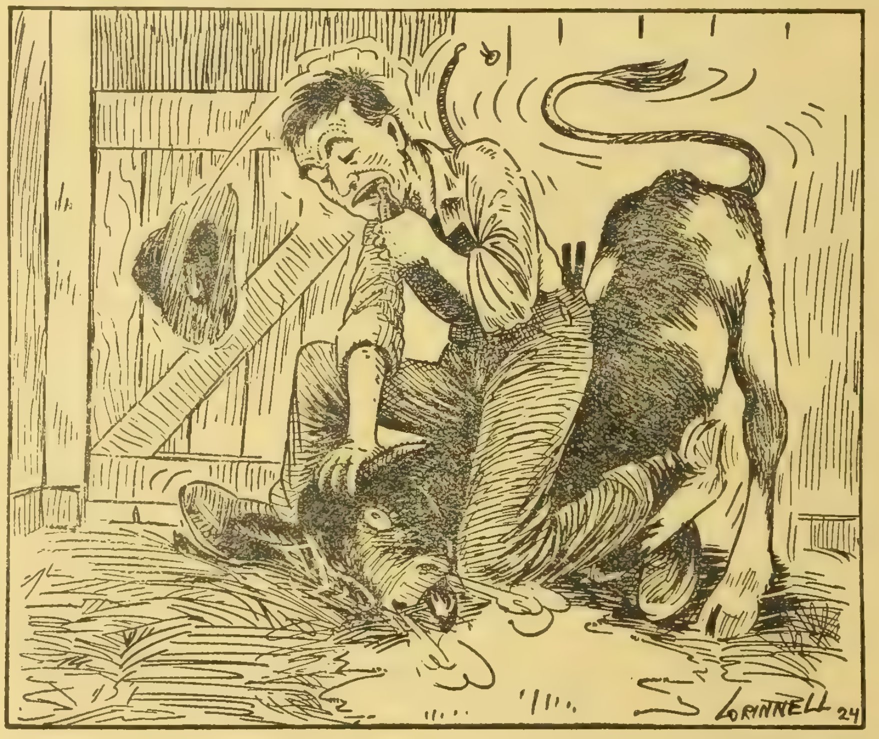
First you enter the pen where the 3- to 5-day-old calf is circulating, boot him off to one side and deposit in the lightest corner of the pen a nice bunch of straw which I forgot to say you were carrying.

Then you go to the medicine cupboard and dig out the glass bottle in which you interned your stick of caustic potash last year when you used it last. And you find that your stick isn't a stick at all but a bunch of powder. So all is off until you happen to be in town and after being there a couple of times you happen to remember to buy a stick of caustic.

Ready now for a new start, a few days later. It is true, you find the procedure still very simple. You carry into the calf pen a big armful of dry straw, dump it in the lightest corner, flop the sniffling calf thereon and camp astraddle of his writhing frame. And remember that you should have brought along the clippers to cut his forelock away from the horn buttons. So up you rise, go back to the medicine cupboard, tetar things out right and left and finally find your clippers, not there at all but over at the house where you used them Sunday for cutting the boys hair.

When you reenter the calf pen you find the calf a trifle wary after having been flopped once, but you finally get him cast again on the dry bedding and you gnaw off the hair around the horn buttons, with the clippers—not your teeth. You have no trouble locating the horn buttons because the calf is maybe 10 days old by this time and his horns are more stubs than buttons. And you find the clipping simple, although there do appear to be a couple of teeth gone out of the clippers, and the calf seems to dislike playing Samson and blats frequently.

Now tuck your clippers in your wampus pocket along with your handkerchief and bagstrings, nails, baling wire, burrs, etc., with which all good farmers are ballasted. Take out your bottle containing the caustic, removing the cork with your teeth. This is good practice because it permits of your using one hand to thrust the calf's head into the bedding also any trace of caustic on the bottle top getting on your lips will indicate whether or not the caustic is active, fresh and worth the dime it cost you. Lay the cork carefully down on the straw.



Take out your bottle containing the caustic, removing the cork with your teeth. This is good practice because it permits of your using one hand to thrust the calf's head into the bedding, also any trace of caustic on the bottle top getting on your lips will indicate whether or not the caustic is active, fresh and worth the dime it cost you.

About now you recall that you should have brought along a can of water to use in moistening the horn buttons. But you hate to go after it, as you are "sitting pretty" on the throbbing calf, and so you spit on your right forefinger and daub one horn button good and proper. After shaking the bottle the caustic finally flies out into the straw. You recover the biggest piece you can, grasp it securely in your right hand and start rubbing it firmly but gently on the moistened horn button.

And directly, Kotyledenous Korndike and Merciful Mercedes! The caustic starts after the wet forefinger you used as a brush; you drop everything you used and rush to swish your burning finger in the cool water of the barnyard tank. It occurs to you at once that you should have donned a glove or else wrapped the caustic stick with a piece of paper.

Among the miscellaneous gloves in the woodshed you eventually discover one meeting the requirements, that is, for the right hand and with no hole in the finger and you go blithely back to the calf pen.

Meanwhile the calf, freed of his incumbus, has been going blithely, too. Pleased at your precipitate removal from his neck he has been tripping gaily with wild abandon about his quarters. The dry pile of bedding, caustic, bottle, cork and all are scattered in every direction. You finally locate a small length of caustic, the calf does not impede your search by sucking your ear as you crawl about searching, nor does he playfully bunt any exposed area. No, he holds apace, his confidence in you severely strained he retreats from your advance with suspicion, so that you must run him down and sprawl him out any old place in the pen, dry or otherwise. You continue where you left off.

From now on the procedure is fairly simple. About the only difficult part is to locate enough saliva, for by this time you are prone to be overheated and dry-mouthed by the excitement.

In the fast waning light you do, however, at last get each horn-stub lubricated, rubbed firmly and unmistakeably with the pea-sized stick of caustic, turning a deaf or deafening ear to the calf's outcries and striving always to keep his thrashing feet out of your pants legs, until the skin over the horn just starts to peel. That's the time to call it a job, a simple job at that.

Michigan Beans May Go Above $5 Per Hundred Pounds Before New Crop

By GERALD HULETT

THIS is a letter written to us by Mr. Gerald Hulett just prior to June 1st. Mr. Hulett is associated with a firm that deals in beans and this fact should be taken into consideration when you read the letter, but he has taken conditions as they are, added them up and given the ultimate results. To us it looks as though he had given the correct answer to the future of the market. He fully believes in higher prices for Michigan beans and recently told us that the farmer cannot long continue to raise beans for less than cost of production. Even the selfish dealer realizes that he will soon be out of business if the farmer cannot make a profit on his crop.

NO one ventures any very logical reason why Michigan beans should be selling below the cost of production at a time when there is virtually no competition. The old bug bear of foreign beans has been effectually eliminated by a dollar seventy-five cent tariff. California has steadfastly and successfully held large and small whites at a level far above the market on Michigan pea beans until now their crop is about exhausted.

Unofficial but trustworthy figures place the marketable yield of Michigan beans in 1923-4 at 8,200 cars of 40,000 pounds each. The estimate of cars shipped from Michigan up to May 1st is conservatively 6,500 cars, leaving on May 1st only 1,700 cars. During May there have been shipped I believe very close to 700 cars and June 1st will not see more than 1,000 cars in the state.

1,000 cars to care for trade demands during June, July and August is a startling modest supply. Weather conditions to date indicate a grave possibility that there will be no new crop of beans available until late September as rain has so far prevented any attempt at planting the new crop. This means that on June 1st Michigan will have to market only a possible 250 cars of old crop per month.

Consider that one large dealer alone claims to have handled in one month on this crop more than 500 cars and you can visualize quite something of a scramble for beans during the next ninety days.

The scarcity is already being felt in the state and with a growing demand quite customary at this time of year the market is looking infinitely better.

Rumors are abroad that elevators have sold short the beans stored with them by farmers. If this be true, and the stories are from such sources that there must be a measure of foundation for them, there is right now a tremendous short interest in this bean market. We are of the opinion that beans held in Michigan today are in strong hands and cannot be dislodged by any absence of demand created by bear dope broadcasted to the trade.

The canners cannot have supplied their requirements up to the new crop deliveries. Business in general is at low ebb and the number of unemployed is great. At such times bean consumption always increases as the housewife is looking for a cheap nutritious food.

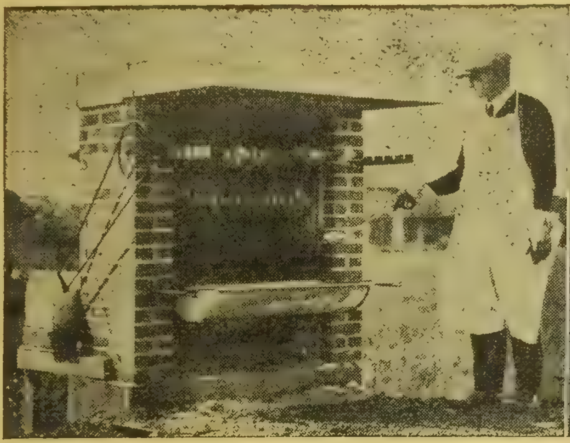
Every feature in the bean situation today points toward higher prices for Michigan beans and it would not be surprising to see a dollar advance in the market before new crop.

Sent In the Coupon Yet?

Have you clipped, filled out and mailed the coupon that appeared on this page in our last issue or have you been too busy to get to it yet? Please send it in at your earliest convenience so that we can get the information all together and then we will be able to give you some valuable facts.

Our readers are giving our request their prompt attention, as they always do, and the number received each day shows an increase. It does not matter whether you have any beans stored or not, fill out part of the coupon regarding your acreage both 1923 and 1924, because we want that information just as much as the other.

PICTURES FROM FAR AND NEAR



THE LATEST IN BARBECUES.—R. W. Wiggins of Cincinnati, Ohio, hit upon the novel idea of putting up this grate along the main highway, and supplying passing motorists with hot roast beef and ham sandwiches. The spit is operated by an electric motor. This might be worth trying here in Michigan.

COOLIDGE MADE MEMBER OF ANCIENT MILITARY COMPANY.—President Coolidge was unanimously elected an Honorary Member of the Ancient Artillery Company of Mass. Photo shows Col. Willis W. Stover pinning on the Honorary Medal.

CARTEL DU TRAVAIL

ELECTIONEERING DE LUXE.—A candidate in a recent French election had a new way of talking to his constituents. He spoke into the transmitter in his auto, and his words were thrown out of a big horn on top, in great volume, reaching all his hearers and not giving himself a sore throat from loud talking.

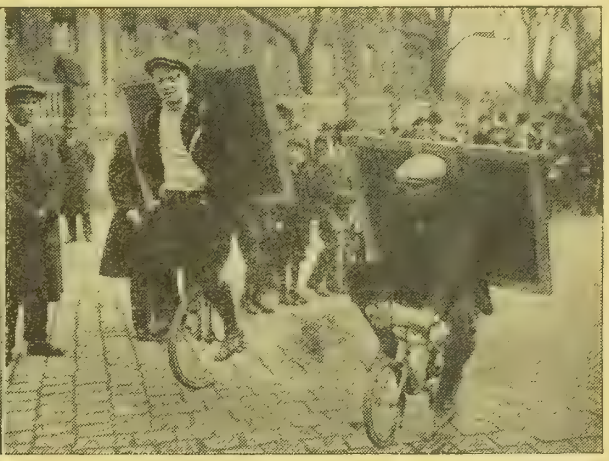
BIG FACTOR IN LEAGUE OF NATIONS.—Miss Florence Wilson of Philadelphia, head librarian to the League of Nations at Geneva, Switzerland, has a real job. She has to supply, at a moments notice, any information asked by the League, relative to their meetings.

A REAL FIRE.—A spark generated by the scraping of a lid on a tank started this fire in St. Paul, Minn., where 6 men were burned, 2 fatally, and more than one million gallons of gasoline destroyed, ending in a loss of about a half million dollars. Flame and smoke rose in a column 300 feet in the air.

EX-SENATOR'S SON CHOSEN AS TYPICAL AMERICAN BOY.—Thomas P. Gore, Jr. 13 year old son of the former senator from Oklahoma, has been chosen as the juvenile resident of the National Capitol as best typifying the "Spirit of American Youth."

SOME HEAVY HITTERS.—This picture was taken the last time the Detroit Tigers played at Boston, Mass. And the list of leading league batters shows that 5 of the leading eight were in the city that day. Left to right: Ty Cobb, of Detroit; Rip Collins, Ike Boone, and Harris, all of Boston; Heilman, of Detroit.

CLAIMS DISCOVERY TO PREVENT CANCER.—Prof. Gaetano Fichera, Director of the Institute of Pathological Surgery, of the University of Pavia, Italy, reports his perfection of a sure cure for cancer.



SOMETHING NEW IN ADVERTISING FROM THE CONTINENT.—Here is the latest thing in advertising in Europe; sandwich-men mounted on their curious wheels. One is on a diminutive bicycle while the other is riding on a single wheel, with as much aplomb as if he was walking.

TO ATTEND PRISON CONFERENCE.—Mrs. Maud Booth, of the Volunteers of America, has been designated by Gov. Smith of New York and President Coolidge as the American representative to the International Prison Conference at London.

FROM CHICAGO TO ROME BY CANOE.—G. H. G. Smyth, Canadian sportsman and Henry Fitzgerald, traveler and soldier, are making this trip. They are paddling their way to New York from where they ship to London. From there they will paddle down the Thames, across the Channel, Oise, Seine, Saone, Durrence, and Mediterranean to Rome.

INDIAN CHIEF AT THE UNIVERSITY OF PENNSYLVANIA.—Chief Joseph Strongwolf of the Ojibway Indian tribe, World War veteran, and 40 years old, is studying Anthropology at the University of Pennsylvania, Philadelphia, Pennsylvania.

FORTY YEARS OF FAKING

The Memoirs of a Grafter—By Himself

THE Master Grafter, Pete Dexter, who changed his name as often as most of us change our minds, got away with a lot of deals in last week's installment. He even got away from the police and although he left most of his money he got such a bad scare he decided to beat it back to his aunt's home and live quietly for a while.

If you have been following Pete's career as he has outlined it during the past weeks you can see that faking is all right part of the time and while a fellow can get away with people's money some of the time, sooner or later the long arm of the law reaches out and gathers him home to prison. Pete was beginning to feel this way every time he got in a close deal and as he stated, a set of "nerves" is a bad thing to have when you are living off of illgotten wealth.

But Pete has a few tricks left up his sleeve. You can bet that it was a good one that finally caused him to come to grief and it's really funny how easily he was caught napping. He just couldn't reform and this week he tells how he managed to keep up appearances and do a job which was about as honest as any he has handled.

CHAPTER VIII

DURING the winter of my second year in the town "looking after my aunt's affairs" I made the acquaintance of a fellow who was supposed to be a lawyer. He had a little old office down next to the post office and the boys used to gather in Blake's office and talk over the war and politics and other weighty questions. Blake, that was the attorney's name, never seemed to be extra busy and finally one day, when he and me was in the place I up and asked him what his business amounted to.

"Well, sir, I'm a patent attorney," says he.

"And what's a patent attorney?" I asks, "anything like a patent medicine?"

Blake laughed in his usual manner and proceeded to tell me just what he did. It appeared that a lot of people that had ideas were always wanting to get a patent so Blake took advantage of the opportunity and would get the records straight for them and see that a firm of attorneys for whom he worked in Washington got the red tape unwound and a patent issued. Blake got a good commission for all business he sent in and he always collected $10 or $15 for his own part of the job. Blake had the way of making every one feel that whatever he did for them was worth about twice what he charged for it and after a lot of talk on the subject I had another of my bright ideas.

As long as I had to stay in the town to take care of my aunt's business, why not be making a little cash on the side? The more I thought of it the better the plan looked so one day I drops in on Blake with the following plan.

My scheme was to organize the American Patent Corporation. Blake was to be the attorney and I was to be the company. With my capital we opened a Washington office and I took charge. Didn't have to be their all the time as we found a place where their was a nice clerk who would forward us any mail addressed to our Washington office for a few dollars a month.

We started a lot of advertising literature in the various papers telling of the fortunes that had been made in simple patents and advised anyone with a contraption to send it to us. We were to examine it and tell them if it was worth patenting or not. After we had advised that it was (for we always did) we asked them to send us $25 which would cover all charges of investigating and other details and in return we sent them a swell engraved certificate which was nothing but a bluff as all it said was that the person named on the certificate was a customer of the American Patent Corporation.

When we had a bundle of applications on hand Blake would hop a train for Washington and spend a day looking up prospects of patents and talk things over with the Washington attorneys and he generally came back with a bundle of patents covering all kinds of devices from flea catchers to anti-cow kicking attachments.

Our next step was to notify the owner of the patent we had secured that he had an unusual device and there was a fine chance of his making a lot of money out of it, if he could only get the right firm to start making them. Here's where the American Patent Corporation came in. For an additional $20 we would place the patent in the hands of our sales department and he would personally visit manufacturers and try and sell the device. We got most of the gang in on this scheme and after a while we announced that we had been appointed representatives of the Grand Patent Exposition to be held in Boston or New York and that the chairman of the exposition was very much impressed with a number of our patents among which was the one of the fellow we were addressing. It would be a great pleasure on our part to exhibit this patent and we wanted to and desired the permission of the fellow to do so. Of course it would cost $10 for space to fix up a proper demonstration. The owner of the patent generally felt the high honor we had imposed on him and the ten bucks was soon in our possssion. Of course we never exhibited the layout. There is a patent show each year in the cities but we didn't worry about it. Most of our gang were located far enough away so they never turned up and besides, we always made sure whether they expected to attend or not in advance. Blake kept track of these fellows pretty well and he managed to satisfy the few that came, entertaining them so royally in the city they generally forgot what they came for.

Next step was to notify the gang that their device had been awarded a prize for excellence and we would forward a letter telling about the committee's decision and this permitted the owner of the patent to send $5.00 for a handsome diploma and if he cared to secure a handsome bronze medal which the Patent Exposition was awarding that could be arranged for $5.00 more.

Being a pretty good writer and knowing what got the eye, I handled the mail business. With the aid of a local printer we prepared some swell letters, diplomas and the like and a local stamping company made us some medals for a small price.

With Blake and me working most of the time sending out answers to the inquiries to our ads in a lot of country papers, we hardly had time to get our checks in the banks. A lot of fellows heard about our exhibiting patents at the big shows and they asked permission to send us money so they could get in on the deal. At the end of our first six months we had to move to a larger office and hired several clerks to keep our business from swamping. I didn't realize how easy money was to get. It just rolled in. This was right after the war when everyone was flush and fellows who had ideas that they had been carrying around for years began to draw plans and send the stuff to us. The money came in to fast that I was just a bit suspicious. I was afraid we might get snagged by the post office department but Blake was a pretty shrewd lawyer and he was sure we were safe.

At the end of two seasons I had a case of nerves and one day when Blake and I had a little argument I offered to sell out. It seemed that he had a friend who was anxious to get in the business and so Blake took me up. I turned over my interest to him for a good price and placed my money on ice. My luck had come back and I felt that for a fellow of my age I was going good. Besides I had run onto another plan that looked better to me and the chances for better profits appealed to your truly.

I had been noticing, while hanging around the post office, that there was a big business in baby chicks going thru the mails. I talked to a fellow about it and he told me how one firm in Cleveland was doing a half a million dollar business each year. I had investigated and found much to my surprise that I didn't need a thing to get into this business but a little advertising copy and a connection with a hatchery. I could be a chicken broker. All the orders I got I could turn over to a hatchery and let them ship the chicks in my name. It looked honest enough to me and I couldn't see where I could get into trouble so I decided to take it up.

We entertained them so royally in the city they generally forgot what they came for.

So I organized another company. I made a trip to a western section of the state and contracted with a fellow who had a big factory to furnish the chicks. Then I had a lot of cards printed telling about the Mongolian Hatcheries. I stated that I could furnish 57 different breeds, and of course I managed to get my prices below any other person in the business.

When I got an order for 100 Rhode Island Red chicks, I sent the order out to my western representative, and he filled it. This man, I knew, wasn't filling the orders with real blooded chicks, but I did not care. For the price you couldn't buy chicks like I was selling from anyone. It sure was funny how people fell for my circulars. The only thing they saw was the price, and they never worried about quality—that is, not just then. Things were fine. I sold thousands of chicks of all breeds that spring, and both the fellow running the incubators and myself made money.—(Concluding chapter in July 5th issue.)

MICHIGAN STANDARDIZATION PROGRAM SHOWS RESULTS

STANDARDIZATION of fruits and vegetables has been making rapid progress in Michigan during the past year. Growers and shippers, recognizing the importance of standardization and the absolute necessity of shipping sorted and graded products, have been eager to cooperate with the Michigan State Bureau of Foods and Standards, Lansing, in the enforcement of the apple, grape, peach and potato grades. The potato and grape grades are mandatory, according to State statute.

The potato grades, which are the same as the U. S. grades, were not promulgated until September of last year. Every important shipper in the State was sympathetic to the grades and the making of them mandatory, and throughout the season the finest kind of cooperation was evident, with the exception of about five smaller shippers. The majority of potato shipments were moved according to grade and properly tagged. W. P. Hartman, Director of the State Bureau of Foods and Standards, estimates that at least one and a quarter million dollars will have been returned to the Michigan growers and shippers this season as the result of the grading program. He bases his estimate on the discriminatory prices against Michigan potatoes that have been evident during the past few years. In addition to obtaining increased returns during the shipping season just closed, desired markets have been established for future years.

Pear growers are petitioning the State Bureau for mandatory grades for pears. Celery and onion growers are showing an interest in the same form of standardization.

A substantial improvement in the quality of all produce shipped from Michigan has resulted from the grading program, Mr. Hartman states. Within the past year there has been a greater demand for Michigan products, a greater confidence in the shipments, and a considerable reduction in the number of requests for terminal inspection.

Solved!

"Doctor, can you cure me from snoring?'

"Do you only snor in your sleep?"

"Yes, but I snore so loud that I awaken myself!"

"Well, the best thing is to sleep in another room."—Klods Hans, Copenhagen.

Milk-Fed

He was one of those fresh young fellows given to the use of slang. At the breakfast-table, desiring the milk, he exclaimed: "Chase the cow this way, please."

"Here, Jane," said the landlady, "take the cow down to where the calf is bawling."

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

HELP TO GET BONUS

IF any of our paid-up subscribers who served in the World War have any trouble in getting the bonus we will be pleased to help them. The service is yours for the asking, there being no charge for service to our subscribers who have their subscription paid in advance. Kindly give us all details in your first letter and sign your complete name and address.

CANNOT MEET NOTE

I bought $300.50 worth of stock and farm tools at auction in March 1922. In March, 1923, I could not make the payment, so I went to the owner and told him that I could not meet the payment and he would either have to take the interest or take the stock and tools back. He said he did not want the stock but he would take the interest. This note was for one year only. Now the second year is up and I have not the money to pay for the stock. I cannot make any payment or interest. Can he force me to pay either if I give the stock back? For the second time I told him to come and get the stock and tools, but he always says he doesn't want it, and he did not have any use for it. One of the horses died after I asked him the second time to come and get them because I could not pay for them, and he refused. Am I compelled to pay him for the horse or not? I bought the farm off the same man on contract. If I should leave the place this spring, can he make me pay the taxes for the coming year or not?—J. M., Boyne City, Mich.

YOU would be liable for the payment of the amount of the note and interest when it comes due. The man who sold to you would not have to accept the return of the stock. Under your contract of purchase, you would be liable for the entire amount of the price you agreed to pay. If you forfeited your land contract and returned the farm to the owner, you would not have to pay future taxes.—Asst. Legal Editor.

WOULD BE CONSIDERED AN ALIEN

I am sending in a question I would like to have answered through your excellent paper at your convenience. I am a subject of Great Britain and wish to make a short visit to Canada. Under the present immigration laws would I be prevented from entering the United States when I wish to return without trouble? I will make a statement that I was born in England. My parents came to Canada and brought me when I was six months old. I lived there until I was twenty-one years old, came to Michigan and made my home here ever since. Have never taken out full citizenship papers. In 1889 I took out first papers but neglected to do any more until they were outlawed. Have now recently made application and taken out papers but have to wait two years to become a citizen. I am a farmer and own my own land (124 acres). If you have any way to find out for me I will greatly appreciate your kindness.—J. K., Parma, Mich.

INASMUCH as you have not been naturalized you would be considered an alien upon leaving the United States, and would be subject to the same requirements as other aliens who desire to enter the country, except that if you did not remain away for as long as six months, you would not be subject to the quota. The immigration officer at the port where you embark can give you the information you desire. You would likely have to see him personally and give him all the circumstances of your case.—Asst. Legal Editor.

ERADICATING QUACK GRASS

Please tell me how to get rid of quack grass. Also would you recommend the use of oats as a nurse crop for a late July seeding of alfalfa?—O. H., Muskegon, Mich.

ONE of the most successful methods of eradicating quack grass is to allow the plants to come into bloom and then cut very close to the ground the same as for hay. At this stage the roots contain less plant food than at any other time and by cutting off the leaves, the roots are still further weakened due to the fact that the leaves do not have an opportunity to assimilate plant food. The quack should be kept cut or grazed until fall and then plowed. Frequently some clean cultivated crop may be put on the land the following season. It will be necessary, however, to go over the land a number of times in order that the growth may be subdued. Persistant clean cultivation is the most successful method of eradication.

I would not recommend the use of oats as a nurse crop for a late July seeding of alfalfa. The oats will make use of the moisture and plant food that should be secured by the young alfalfa plants. In this way the alfalfa plants frequently do not make a sufficient growth to prevent winterkilling. When alfalfa is seeded during July the plants should make sufficient growth that winter killing will not be a factor. A nurse crop is of some value when alfalfa is seeded in the spring due to the fact that the nurse crop will tend to prevent the growth of weeds.—C. R. Megee, Assoc. Prof. of Farm Crops, M. A. C.

ENTITLED TO YEAR'S NOTICE

Enclosed find $1.00 for your valuable paper, which we cannot offord to miss, as we enjoy it very much. Would like your answer as soon as convenient. Three years ago we moved on a share farm, no contract was made as to time, as owner said the farm, would never be sold, and hoped we would stay at least five years. Now he has a buyer for the farm and wants to sell. I wish to know if in case he sells same, if we must move now or if we can remain here till March 1925? Must not we be informed the first of the year to leave? When we moved on, there was 40 acres of fall crops out, what rights have I to put fall crops out? We have three small children and would appreciate your answer very much.—A Faithful Reader, Vicksburg, Mich.

IF it was understood between the parties at the time the oral agreement was made that rent was to be paid yearly, I am of the opinion that you are holding under a tenancy from year to year, and accordingly are entitled to a year's notice to quit.—Asst. Legal Editor.

WHO GETS INSURANCE?

I am a subscriber to your paper and would like a little advise. It a man has his life insured, benefit of wife and she dies three years before he, who does insurance go to? They owned all jointly. Also can an administrator be appointed without consent of heirs, and can he sell all property against wishes of heirs who wish to keep some or all of household and furnishing goods?—F. C. S., Bellaire, Mich.

UPON the death of the wife as beneficiary under the policy, her benefit would go to her heirs. An administrator is not entitled to be appointed without the consent of the heirs of the deceased. The question of selling the property is determined by the wishes of the majority of those interested, including the heirs and creditors.—Asst. Legal Editor.

BANK CAN COLLECT

I have a question I would like to ask, it is the following: If A borrows $2,000 at a bank and B goes security and A fails to pay the notes, can bank collect same from B? B owns farm jointly with his wife. Can they get judgement against the farm? Can they take personal property? Thanking you in advance, I remain—A Subscriber, Hesperia, Mich.

THE bank could collect the amount of the note from B out of his personal property. However, the farm which B owns jointly with his wife could not be taken for the payment of this obligation. —Asst. Legal Editor.

WIDOW GETS ONE HALF

Will you please answer through the Farmers' Service Bureau this question? If a man dies, leaving no will, what does the widow receive, there being one child, of the real estate and personal property? What is her share if there are no children?—Mrs. L. H., Charlotte, Mich.

IF there is one child the widow would receive one half and the child one half of the real and personal property of the deceased. If there are no children and no issue of a deceased child, the widow would receive all the personal property up to $3,000. All the personal property over this amount would be divided between the widow and the deceased's parent's, she receiving one-half and they receiving one-half. And she would receive one half the real property, the deceased's parents receiving one-half.—Asst. Legal Editor.

LAWFUL FOR WOMAN TO VOTE

Is it lawful for a woman to vote on general or any election if she is not a land owner or if she has not a joint deed with her husband?—J. E. C., Au Gres, Mich.

IT is lawful for woman to vote at general and special elections even tho she is not the owner of real property.—Asst. Legal Editor.

WAS STOCK INCLUDED IN CONTRACT?

Would like your advice on a contract. A bought a farm from B with 2 horses, 2 cows, 2 hogs and paid $1,000, has paid all taxes and interest but cannot make 1924 interest. If B foreclosed would A have to leave said stock on place?—W. H. S., Leslie, Mich.

IF stock was included in the contract, I am of the opinion A would not have a right to remove them from the place in the event B forecloses.—Asst. Legal Editor.

USE POISONOUS SPRAY ON WILD MORNING GLORIES

Could you please tell me how to kill Wild Morning glory. I have a field that has quite a lot in.—A. J., Breckenridge.

THE Wild Morning glory is a pest that is very difficult to handle for the reason that its under ground stems are very pertinacious. Ordinary methods of cultivation are not successful because they do not destroy the plant completely and usually merely serve to drag various portions to uninfested parts of the field. If cultivation is attempted it must be so thorough that at no time do any green leaves remain above the ground more than a few hours before they are destroyed by cultivation.

If the infested portion of the field is not too large that portion may be broken with a plow and then fenced in and hogs turned in. They will clean out the underground parts, particularly if they are not too thoroughly fed before hand.

Certain poisonous sprays are effective. These are sold under the name of Weed Killer and are put out by various firms. These are almost all solutions of various strengths of arsenic compounds, usually Sodium arsenite, and must be diluted and sprayed on the plants in accordance with directions on the cans. It should be remembered, however, that the Wild Morning glories require stronger solutions than some other weeds. In California these arsenic compounds have been very successful with Wild Morning glories in some types of soil and not so successful in other types. It must be remembered that this is a deadly poison and that any form of ilvestock eating plants that have been sprayed, even a number of days later, will be killed. It will be necessary, therefore, to fence out all stock from the sprayed area until there have been several heavy rains. This poison will kill other plants as well.—E. A. Bessey, Professor of Botany, M. A. C.

WIFE GETS ONE HALF

If a man owns land before he is married, also personal property, after death would wife get all or could his relatives step in for a share, where there is no joint deed or will or children. Thanking you in advance.—L. H. A., Benzonia, Mich.

UPON the death of the husband the wife would be entitled to one half of the property and his father and mother one half, or brothers and sisters, in case both the mother and father were dead.—Asst. Legal Editor.

HOLDER OF SECOND MORTGAGE CANNOT FORCLOSE

Can the holder of a second mortgage foreclose if the one that holds the first would not agree to sell his share? First mortgage will not be due for nearly a year, second one will now be due soon. Will second party be obliged to wait until first mortgage is paid?—A. C., Cooks. Michigan.

THE holder of a second mortgage cannot foreclose until the first mortgage is discharged.—Asst. Legal Editor.

HUSBAND WOULD GET FARM

If my sister and her husband owned a farm and had a joint deed and no children and if she died, would or could her mother claim my sister's share of the farm, or would the husband have full claim on the farm? Please oblige, Mrs. G. W. G., Evart, Michigan.

UPON the death of the wife, the husband would be entitled to all the real estate which they held jointly.—Asst. Legal Editor.

OUR READERS' NEW BUILDINGS

Have you built any up-to-date farm buildings lately? If you have send us a picture of the new building and we will print it in this new department. It will show the M. B. F. readers what their distant neighbors are doing to change the scenery. And, incidently, you may be able to help some farmer decide the type of house, or barn, or other buildings he desires to put up. He may like the appearance of your building and will want the plan of it. Kodak pictures are all right if the details show up well. Do not send the negative, just a good print.

HOME OF MR. AND MRS. EMIL RHODE, MT. PLEASANT, MICHIGAN
Mr. and Mrs. Rhode write that their home is a modern eight room bungalow, 26 feet by 32 feet, with an addition, nine feet by eighteen feet, on the west end. The porch is eight feet deep and runs across the entire front of the house. They have furnace, bath, hot and cold running water, and gasoline lights. Woodwork is of hemlock and doors are fir with floors of oak and pine. There is a basement under the entire house, eight and one half feet deep.

What the Neighbors Say

LIKES TAX ARTICLES

DEAR Editor:—I have been a reader of THE BUSINESS FARMER for three years and like it very much. I have read all of Mr. Powell's articles on Taxation and agree with him to the letter. Now when I read Mr. Eaton's letter I cannot help but write so Mr. Powell will know he has my support. Mr. Eaton may pull the veil over some peoples eyes but not mine, as a farmer who pays taxes, and taxes are increasing every year. He cannot make me believe the Governor and his administrative board have cut down expenses yearly.

The first thing the Governor did was to increase the number of state employes by a great many and raise the salaries of some. When Mr. Eaton says there is no money used —only as appropriated by the legislature I would ask him if the money to build the Island Lake road and Pavillion and to buy a $5,000 car for the Governor and cars for the other state officials was authorized by the legislature.

I wish to thank Mr. Powell and the M. B. F. for putting the facts and figures before the voters of the people of our state.—W. D. Cheeseman, Barry County, Mich.

WHY THE FARM BOY LEAVES SCHOOL

TO the Editor:—I wish to explain the great mystery to Dorothy Dill. First the life of a small boy on a farm is so unpleasant, his pleasures so few, and work so hard that he as a rule is not a bright pupil in the school.

As he grows older his work becomes harder, his hours longer, and his desire for something else stronger. It is at the age when he is disgusted with the farm, with all of its slavery and no money for himself, that he finishes his education in the eighth grade. About at this time he is doing far more work on the farm than one would dare ask the hired man to do, and receives his board and room, with a few cheap clothes for his reward.

Of course he wants to escape from this dull life; any red blooded young man would. He does not, under the conditions that he has lived, long for a life on the farm. His longing is for less work, better living conditions, more pleasures, and his eyes naturally turn toward the city. Here he knows they all can be found.

Also it would be impossible for the old parents of the boy to send him to high school or college. They need his cheap labor. It is then that he makes the step up the ladder by leaving the worn out farm, and the life of toil and enters the city. Yes, he may enter a factory, store, railroad shop, or a great many other openings spring up before him. Now with short hours he has a chance to study in Y. M. C. A., night school, business college, or even with the help of good books he can improve his education, and in a few years work himself up in the place where he started.

It is seldom now days that a factory or other place doing big business closes down, and throws one who is willing to work, out of a job. Of course, there are times when one is laid off for a brief spell, but as a rule does not mean a hardship for the worker. His mind is on his work, he thinks of improvements that could be made on the machinery, etc. He expresses them, and is rewarded by promotion and increased wages or salary. He is living now as he could never have expected to live on the old worn out farm of Dad's. This partly explains the mystery, Dorothy Dill.—Ralph Jordan, Petoskey, Michigan.

TAXATION AND THE FARMER

ON an upper stretch of the much toured Dixie "trail" in Michigan there is a lately abandoned farm. Its occupancy was indicated last fall by hay still remaining in the barn, there being then no market for hay. Its abandonment, which did not at first appear from the road was attested by the dismantled pump at the well and by broken branches of apple trees, indicating another species of highway invasion. The main highway robbery had occurred when the owner was taxed off the farm. This place—and its number on this and all roads in Michigan is legion—bore mute testimony to the policy of a state which has been building concrete boulevards and taxing farm lands six per cent on valuations already increased out of all relation to possibilities of selling.

In fact the caption at the head might by a slight verbal change appropriately read "Taxation or The Farmer". For the hour has struck, and in this state at least we must immediately decide, if agriculture is to have a chance of survival. It cannot continue with low selling prices coupled with hay buying prices, on top of that, inflated wages due to the automobile and the war, and at the top peak of all taxes that have reached the point of confiscation.

The cost of hard surface highways must be taken off land, at least off lands being used for food production. The motor traffic which demands these should pay for their construction and maintenance. This is in no wise affected by the accidental fact that the farmer may occasionally run an auto. The principle is that the land should be relieved and the traffic, but for which they would not be ought to pay the cost. Neither on the ground of assessment for benefits nor that of contribution for general public purposes is road taxation of land justifiable. Without these luxurious highways automobile manufacturing would not have flourished like a green bay tree. Apace with its advance agriculture has declined. The latter is entirely unable to bear the burden. The former is apparently able. If unable the remedy is at hand. Let the Detroit Automobile Club, which is fostered by the motor manufacturing interests, demand a road holiday, and the state administrative board will not hesitate to suspend the issue of bonds for the construction of trunk lines. Nor as to county ways will petitions be circulated under the Covert act if the out worn theory of special benefits is once put in the discard. This remedy looks drastic. It is more radical than gasoline or state income taxes. But is it not needful that the cure go to the roots of the disease? If food production can no longer make a six per cent margin, it certainly cannot stand six per cent taxes. For the raising of food is not done solely for pleasure. The taking off the farmer's back of that portion of the tax load which is raised for road purposes may not be radical enough. The fact is our basic industry is swamped. Its future is menaced by a great and growing crop of weeds. Noxious weeds made great headway during the war. The fight against them has been a losing one and is utterly hopeless with no help in the country. No longer is a pretense made of enforcing the weed cutting statute. What this extension of foul growth means to any successful cultivation of the soil need only be suggested. Now if motor manufacturing can afford to pay the price that draws into its meshes all rural labor, why cannot and should not it pay for fundamentally essential work this labor would otherwise have performed. That question may very shortly have to be asked. But this can at any rate be said well within the bounds of moderation, that, rather than have farming taxed out of existence, the automobile industry might sooner for its own welfare step under the extra tax load it has brought into being.

If, however, it protests that its taxes are high enough, no fear of factory removal should stop this fair correction of an unjust situation. Let it be remembered that no state has been more liberal than Michigan in its treatment of this industry. It will not fly elsewhere. Nor is there apparent danger of the factory being killed. Unlike the farm tiller, whose prices are set for him, the motor manufacturer can pass added cost on to the purchaser. If this curtails the sale that would not be the worst thing for society.—F. W. Newton, Saginaw County, Michigan.

REINFLATION

DEAR Editor:—I wish to commend Mr. Bennet on his article in your paper of April 26th entitled "An Over-production of Crops and Advice." He pointed out, as others have, that the deflation of currency in the latter part of 1920 was the beginning and logically the cause of the present financial depression of farmers; that our huge public and private debts were contracted during inflated values and and now we are unjustly required to meet our inflated obligations with deflated prices for our products. I wish to point out, further that since deflation was the cause of our troubles that the most logical and only complete remedy is reinflation.

According to the official report of the secretary (a copy of which I have at hand) there was $50.11 per capita in circulation in 1920. Then we were prospering and business in general was booming. By 1922 the currency was reduced to less than $40. We all know the disasterous result. While farmers suffered most, all industries felt the sting of reaction. In 1923 the amount was increased to $42.50—hence the much heralded improvement in the agricultural situation. Now if an increase from $39.86 (the amount in 1922) to $42.50 gives us marked improvement, what would a return to over $50.00 do? Plainly this: It would give us a return to the prosperity we were enjoying in the fore part of 1920.

Plainly our economic salvation is in the hands of the administration through the treasury department and reserve board. If the expressed sympathy of our friends (?) in Washington isn't empty prattle it seems to me they will consider the matter more seriously and meet the issue from the true standpoint. Personally I have but little faith in any measure which does not include reinflation, for to have property we must have sufficient money in circulation. Most of the proposed measure to help farmers, would only serve to postpone or side track the real issue.

I should like to hear from others on the subject.—Wm. G. Conklin, Van Buren County, Mich.

TOO SMALL PROFIT

TO the Editor:—As I am a reader of your paper I saw an article on the editorial page of March 15th, of which I could not approve, along the lines of cooperative marketing. Now if this business was handled along the same lines as our maple syrup was in 1918, by a clearing house in Detroit, it sure would be some business, or the wool pooling along about the same time, Mr. Farmer would soon have to give up his Tin Lizzy, and resort to old Dobbin and the shay. Radios would sure be out of the question, and I think you know something about how those things were handled at that time, and still you seem to wonder why so many farmers are leaving the farms.

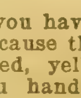
Well, you have the wrong idea. It is not because they are weak kneed, jelly-spined, yellow backed, as the dope you handed to them in the same issue. It you really think so, why not get out of your easy chair and give it a trial yourself, you will know then the difference between talking with the pen and following the plow. As for myself, I really like the farm work the best of all, but when it comes to working sixteen hours a day for at least nine months, out of twelve, then fourteen hours a day for the balance of the year, and then when you balance your books you find you have the large sum of about two and a half dollars per day left for your labor, you ought to be pretty well satisfied, don't you think so?

Well, as to the politicians he is all right, and it seems that he seldom, if ever, thinks of the folks at home, and it is so plain to be seen that a blind man could feel it with his cane. You speak of the farmer helping himself, but to the man behind the plow under the past and present situation, it would be a hard task when the prices are set by the gamblers before he can get the seed in the ground. Now if the farmer had anything to say about the prices of the implements he works with, it is out opinion the doors of such factories would be closed in a very short time, and a good many of us look at it in the same light.

We can close up our part of farming if we see fit to do so, and we are not yellow under any ray of light that you can turn on us.

Now I have figures that I will give you that are absolute facts, and the real thinking, working farmer you speak of, is slowly but surely to some extent, closing up his business no matter how strong his heart may be, for he cannot pay the wages he will have to pay and get the money out of the crops he grows.—A. D., Petoskey, Mich.

Uncle Rube Spinach Says:



JUDGMENT

YOU know I've got young nieces, cousins an' things like that, an' a daughter an' everything an' one of the dear young things sez to me a few days ago, she sez: "Grandpa what do you think of the new styes of dress for women," she sez. "Oh!" sez I cas'ly, "have they got new styles?" I sez. "Why," she sez, haven't you noticed that they were wearin' 'em longer than a year ago an' more clingin'," she sez. "Why Irenie," I answered, "I hadn't hardly noticed they wuz wearin' 'em at all" I sez—You know since my eyes kinda failed me out at the bathing beach I ain't paid much 'tention to the styles. "Are they wearin' 'em longer now?" I sez. "Do you mean a longer time or length or vice versa?"

"Oh Dad," she sed, "you are so dumb. I guess you are gettin' old all right,—don't you notice the girls any more?" An' I sed, "Not to speak of particularly—guess I've seen 'bout all there's to see ain't I. An' you know, Bernice," I sez, "when you've seen all, there ain't any more is there?"

Well Luella, one of my nieces, seemed surprised that I should show how little I know an' fin'ly she sed, "I want to ask you if you don't see a diff'rence in the way we dress today an' when you were younger 'an you will ever be again." "Oh yes," I sez, "I git you now! I guess I know what you're gettn' at. When I wuz young and your great grand parents wuz 'bout 50 years younger," I sez, "girls undressed an' dressed in the dark an' when they came out where folks could see 'em they had their clothes all on. They had hoop skirts 7 feet wide, you couldn't get near one if you wanted to an' their waist line was always fixed, the corset an' the hoops fixed it. Yes, yes, I remember the old styles well," I sez. "Have they changed 'em lately?" I asked her.

"Now Dad," sez she, "you jest wake up. Look at me," she sez an' —well—I can't tell jest how it is, but somehow our girls seem jest as nice today as they were 50 years ago. Yes bobbed hair an' mebbe bobbed skirts—mebbe a cigarette now and then. I don't like cigaretts myself but equal rights permits a lot of things. I don't like to see a young man smokin' 'em when with a lady, the same objection on the other side. But anyway the world's goin' on most every day—we see what's called a flapper today, next thing we know she'll be a mother an' jest as good an' as nice as any mother we've ever known.

An' in spite of any think we think or say or do our girls—bobbed though they may be—will come through all right, will make good wives to good husbands—if there is such animals—good mothers in spite of the husbands, and thats the end of the story of what my relations sed to me. Cordially yours, UNCLE RUBE.

P. S.—When I was at the age the girls spoke of I don't rec'lect of so many female painters as what we have today, an' 'nother thing—if you seen her with brown hair today she'd most always have the same colored hair when you met her again, an' her eye brows were real hair an' no silk stuck in her eyelids—yes, I do see a diff'rence in some things.—U. R.

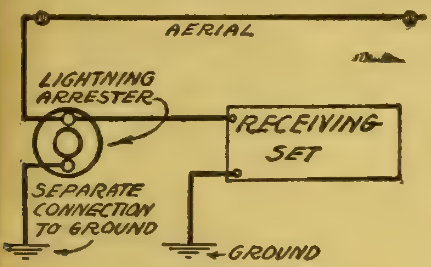
RADIO DEPARTMENT

EDITED BY J. HERBERT FERRIS, R. E.

LIGHTNING DAMAGE AND RADIO

NEARLY every owner of a radio set becomes worried as soon as we begin the summer, fearing that their aerial will cause lightning to hit the house. There is absolutely no danger of lightning hitting your house even during the most severe thunder storm if you have properly installed your radio set and aerial.

Actually, a well put up aerial is a protection and not a hazzard as far as danger of fire and lightning damage is concerned. The aerial acts as a good dissapater of electric charges and for those who have not placed lightning rods on their houses it becomes a safeguard against lightning.

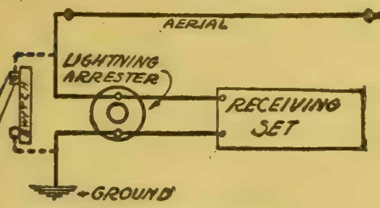


Using lightning arrester.

Not only can lightning damage your house, but very small electric discharges may ruin your radio set for you, therefore it is necessary to properly install your radio set with it's lightning arrester.

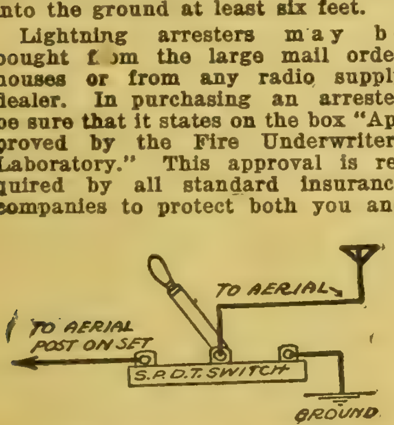
Every aerial should have at all times connected to it, during both summer and winter, an approved type of lightning arrester. There are two types of arresters made, one the vacuum type, which is a small glass tube with two wires in it, separated by a short space and with most of the air taken out of it. The other is made with two pieces of carbon separated by a very thin piece of mica. Both of these arresters are made to discharge at a pressure of 500 volts.

Lightning arresters may be placed inside of the house or on the outside of the house, and are continually in service, as one post is always connected to the aerial and the other post to the ground. The ground connection can be the same one that you use on your receiving set or a separate ground wire may be run to a rod or pipe that is driven into the gound until it is in contact with permanently moist earth, this means that it should be driven into the ground at least six feet.



Using a switch.

Lightning arresters may be bought from the large mail order houses or from any radio supply dealer. In purchasing an arrester be sure that it states on the box "Approved by the Fire Underwriters Laboratory." This approval is required by all standard insurance companies to protect both you and them from carelessly installed aerials. For should lightning by chance hit your house the insurance adjuster is going to ask you if you had a lightning arrester installed and what make. It it was an approved type you will get your insurance and if it is not an approved type you may not be able to collect your insurance.



Using both arrester and switch.

The diagrams would show you how the arrester should be connected to your aerial and should be followed carefully.

An additional safety device that many people use (I use it) is to place a single pole double throw switch in your aerial circuit, and whenever you are not receiving thow the switch to the ground side, and then your aerial will be directly grounded and no lightning discharge can pass thru your set. A single pole single throw switch can also be used. The diagrams show the connections for both.

We recommend that a switch be used and at the approach of a thunder storm that you throw the switch to the ground connection and refrain from listening in until the storm has possed.

CAN YOU GET DETROIT STATIONS?

I HAVE had several letters from readers stating they were unable to get Detroit, or that some other stations farther away came in much clearer. This is rather surprising as there are three powerful stations at Detroit and they have been heard by people over one thousand miles away. Most of these letters came from readers in the northern part of Michigan and I am wondering if this condition is very general in that section of the state. Please write in telling me if you receive one or all of the stations—The Detroit News, WWJ; The Detroit Free Press, WCX; Detroit Police Station, KOP—and which one comes in best. If you cannot get Detroit what stations do you listen to? When you write in tell me about your set and send a picture of it so we can print it.

Questions and Answers

201-A TUBES ARE BEST

Have read your articles in THE BUSINESS FARMER on radio sets. I have a Crosley No. 6 set, two tubes, one amplifier and one detector tube. For tubes I am using two U. V. 201-A tubes. The man that put the set in for us, said we would get better results from them than any other tubes. For B battery am using an Everyready 45 volts, 30 cells. We tried dry cells for the other battery but they would not work so got a storage battery, that is a Rub-Tecx. The set has worked good until lately. Had the battery charged about two weeks ago, since then, we have not been able to get very much, and what we did get we could not clear up, so we understood it. I was wondering if our B battery was all right or if that was gone. Have had it since in May. Would like a two-step amplifier with a speaker but have not money to put into it now. Am thanking you.—W. W. H., Alamo, Mich.

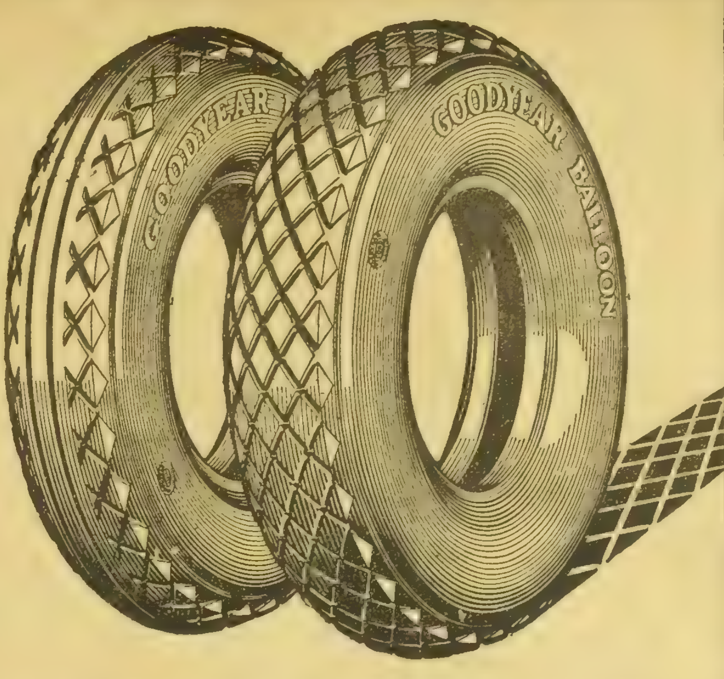
Though the 201-A tubes are not quite as sensative as the old 200, the average results are better or at least as good as that obtained with other tubes and for amplifying they cannot be excelled unless you use power tubes. The man who sold you the set was right.

Evidently you must have had the dry cells connected up wrong for they have and do work on 201-A tubes, though I believe in the long run you will be better satisfied with the storage battery. It ought to last you over 5 years.

I believe that your B battery is weak and that you need a new one, I would suggest that you get 2 of 22½ volts and combine them, for when you get a 45 volt battery if any part of it goes bad the whole thing has to be discarded, but with two of 22½ volts you can sometimes get quite a bit more service out of one than the other and save that way.

There are times, even with new batteries when signals do not come in clearly, if this should last more than 3 or 4 days, then you may be sure that your battery is run down or the A battery is low.

Next fall maybe you will have your amplifier, then you can entertain a whole room full at one time.



AN outstanding feature of Goodyear balloon tires is SUPERTWIST, the remarkable new cord fabric perfected by Goodyear. Tests made with this enduring new material showed that a tire carcass made of SUPERTWIST delivered more than 100% greater service than a carcass made of an equal number of plies of standard cord fabric. SUPERTWIST is used only by Goodyear, and is built into Goodyear balloon tires of *both* kinds—to fit new small-diameter wheels, and to fit the wheels now on your car.

Goodyear Means Good Wear

GOODYEAR

DEAR Editor:—Accept my thanks for the personal reply regarding T. B. testing. I am enclosing 25c for the certificate and sign which I think is a very good idea, as well as helpful. Your paper is wonderful in its getting results as I notice. The tax debate now going on is very interesting and still more instructive. I am crazy about reading debates of any kind, as usually one gets both sides of the idea. More debates if possible. We have a debating club in this community and it sure has some interesting subjects at times. Our last debate was horses vs. tractors, and the tractor admirers held sway by a hand vote. Your departments are as good as can be had for such a small sum. Altho I am no story reader, my wife is just the opposite and the children fight over reading the Children's Hour. And I of course read all of the rest except stories. Will remain a loyal subscriber as ever.

Hoping that the M. B. F. will survive any fatal attempts, I am, John Spiegel, Toivola, Star Route, Box 38, Michigan.

The Whole Family Likes It!

Read Mr. Spigel's letter. It tells the story of how thousands of our readers feel about The Business Farmer.

Every issue is a gold mine of information, pleasure and recreation. Are you digging into it?

Notice Mr. Spigel is getting the full benefit of our Service and Protective Bureau. Are you?

Results are Sure with the Nichols-Shepard Oil-Gas Tractor

It's a simple, powerful, economical, long-lived kerosene-burning tractor built for *heavy duty*.

Just right for threshing, silo filling, sawing, road grading, plowing, heavy hauling, or any other kind of heavy belt or draw-bar work—

Burns Kerosene at All Loads
Starts Easily in Cold Weather
Easy to Operate—Convenient to Get At
So Simple Your Boy Can Run It
Big, Heavy Fly Wheel Stores Up Reserve Power for Any Overload
Drives a Separator Just Like the Best Steam Engines Its Users Say
Economical in Use of Kerosene and Oil
Strong—Substantial—Expertly Built from Best Materials
Long-Lived—Gives Good Service for Many Years

The Tractor You Need to Make Money With

Three Sizes—20-42 H.P. 25-50 H.P. 35-70 H.P.

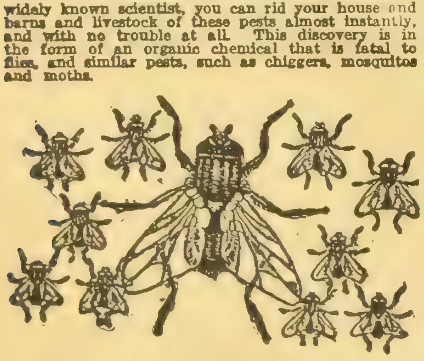
Easy Now To Rid Your Place of Flies

Widely Known Scientist Discovers Wonderful Chemical that is Fatal to Flies. Not a Poison—Harmless to Stock.

Flies are one of the most dangerous and annoying things with which folks have to contend. Now, through the discovery of E. R. Alexander, widely known scientist, you can rid your house and barns and livestock of these pests almost instantly, and with no trouble at all. This discovery is in the form of an organic chemical that is fatal to flies, and similar pests, such as chiggers, mosquitos and moths.



This new discovery, which is called Alexander's Rid-O-Fly, is not a poison. Though it kills flies like magic, farm animals and human beings are not affected by it at all. In addition to killing these insects, Rid-O-Fly is a strong repellant. Flies will not come near stock or buildings where Rid-O-Fly has been used. Rid-O-Fly is particularly valuable for cows and horses, as it is a known fact that flies do untold harm to these animals.

As a special introductory offer Dr. Alexander is giving a regular $1.00 sprayer free with each $1.25 order for Rid-O-Fly. Send name and address today to the Alexander Laboratories, 1584 Gateway Station, Kansas City, Mo., enclosing only $1.25 (check or m. o.). Or if you prefer, you can pay the postman $1.25 plus a few cents postage, on delivery. So confident is Dr. Alexander that Rid-O-Fly will rid your house, barn and livestock of flies that he will cheerfully refund your money if you are not fully satisfied. Don't put up with these annoying, expensive and dangerous pests a day longer. Rid-O-Fly will clean them out.—(Adv.)

Oh Money! Money!

by ELEANOR H. PORTER

Copyright by Houghton Mifflin Company

(Continued from June 7th Issue.)

THE next day Mr. Smith left the house soon after breakfast, and, contrary to his usual custom, did not mention where he was going. Miss Maggie was surprised and displeased. More especially was she displeased because she was displeased. As if it mattered to her where he went, she told herself scornfully.

The next day and the next it was much the same. On the third day she saw Jane.

"Where's Mr. Smith?" demanded Jane, without preamble, glancing at the vacant chair by the table in the corner.

Miss Maggie, to her disgust, could feel the color burning in her cheeks; but she managed to smile as if amused.

"I don' know "I don't know, I'm sure. I'm not Mr. Smith's keeper, Jane."

"Well, if you were I should ask you to keep him away from Mellicent," retorted Mrs. Jane tartly.

"What do you mean?"

"I mean he's been hanging around Mellicent almost every day for a week."

Miss Maggie flushed painfully.

"Nonsense, Jane! He's more than twice her age. Mr. Smith is fifty if he's a day."

"I'm not saying he isn't," sniffed Jane, her nose uplifted. "But I do say, 'No fool like an old fool'!"

"Nonsense!" scorned Miss Maggie again. "Mr. Smith has always been fond of Mellicent, and—and interested in her. But I don't believe he cares for her—that way."

"Then why does he come to see her and take her auto-riding, and hang around her every minute he gets a chance?" snapped Jane. "I know how he acts at the house, and I hear he scarcely left her side at the tennis match the other day."

"Yes, I—" Miss Maggie did not finish her sentence. A slow change came to her countenance. The flush receded, leaving her face a bit white.

"I wonder if the man really thinks he stands any chance," spluttered Jane, ignoring Miss Maggie's unfinished sentence. "Why, he's worse than that Donald Gray. He not only hasn't got the money, but he's old, as well."

"Yes, we're all—getting old, Jane." Miss Maggie tossed the words off lightly, and smiled as she uttered them. But after Mrs. Jane had gone, she went to the little mirror above and mantled and gazed at herself long and fixedly.

"Well, what if he does? It's nothing to you, Maggie Duff!" she muttered under her breath. Then resolutely she turned away, picked up her work, and fell to sewing very fast.

Two days later Mellicent went back to school. Bessie went too. Fred and Benny had already gone. To Miss Maggie things seemed to settle back into their old ways again then. With Mr. Smith she took drives and motor-rides, enjoying the crisp October air and the dancing sunlight on the reds and browns and yellows of the autumnal foliage. True, she used to wonder sometimes if the end always justified the means—it seemed an expensive business to hire an automobile to take them fifty miles and back, and all to verify a single date. And she could not help noticing that Mr. Smith appeared to have many dates that needed verifying—dates that were located in very diverse parts of the surrounding country. Miss Maggie also could not help noticing that Mr. Smith was getting very little new material for his Blaisdell book these days, though he still worked simultaneously over the old, retabulating, and recopying. She knew this, because she helped him do it—though she was careful never to let him know that she recognized the names and dates as old acquaintances.

To tell the truth, Miss Maggie did not like to admit, even to herself, that Mr. Smith must be nearing the end of his task. She did not like to think of the house—after Mr. Smith should have gone. She told herself that he was just the sort of homey boarder that she liked, and she wished she might keep him indefinitely.

She thought so all the more when the long evenings of November brought a new pleasure; Mr. Smith fell into the way of bringing home books to read aloud; and she enjoyed that very much. They had long talks, too, over the books they read. In one there was an old man who fell in love with a young girl, and married her. Miss Maggie, as certain parts of this story were read, held her breath, and stole furtive glances into Mr. Smith's face. When it was finished she contrived to question with careful casualness, as to his opinion of such a marriage.

Mr. Smith's answer was prompt and unequivocal. He said he did not believe that such a marriage should take place, nor did he believe that in real life, it would result in happiness. Marriage should be between persons of similar age, tastes, and habits, he said very decidedly. And Miss Maggie blushed and said yes, yes, indeed! And that night, when Miss Maggie gazed at herself in the glass, she looked so happy—that she appeared to be almost as young as Mellicent herself!

CHAPTER XVII

An Ambassador of Cupid's

Christmas again brought all the young people home for the holidays. It brought, also, a Christmas party at James Blaisdell's home. It was a very different party, however, from the housewarming of a year before.

To begin with, the attendance was much smaller; Mrs. Hattie had been very exclusive in her invitations this time. She had not invited "everybody who ever went anywhere." There were champagne, and cigarettes for the ladies, too.

As before, Mr. Smith and Miss Maggie went together. Miss Maggie, who had not attended any social gathering since Father Duff died, yielded to Mr. Smith's urgings and said that she would go to this. But Miss Maggie wished afterward that she had not gone—there were so many, many features about that party that Miss Maggie did not like.

She did not like champagne nor the cigarettes. She did not like Bessie's showy, low-cut dress, nor her supercilious air. She did not like the look in Fred's eyes, nor the way he drank the champagne. She did not like Jane's maneuvers to bring Mellicent and Hibbard Gaylord into each other's company—nor the way Mr. Smith maneuvered to get Mellicent for himself.

Of all these, except the very last, Miss Maggie talked with Mr. Smith on the way home—yet it was the very last that was uppermost in her mind, except perhaps, Fred. She did speak of Fred; but because that, too, was so much to her, she waited until the last before she spoke of it.

"You saw Fred, of course," she began then.

"Yes." Short as the word was, it carried volume of meaning to Miss Maggie's fearful ears. She turned to him quickly.

"Mr. Smith, it—it isn't true, is it?"

"I'm afraid it is."

"You saw him—drinking, then?"

"Yes. I saw some, and I heard—more. It's just as I feared. He's got in with Gaylord and the rest of his set at college, and they're a bad lot—drinking, gambling—no good."

"But Fred wouldn't—gamble, Mr. Smith! Oh, Fred wouldn't do that. And he's so ambitious to get ahead! Surely he'd know he couldn't get anywhere in his studies, if—if he drank and gambled!"

"It would seem so."

"Did you see his father? I saw him only a minute at the first, and he didn't look well a bit, to me."

"Yes, I saw him. I found him in his den just as I did last year. He didn't look well to me either."

"Did he say anything about—Fred?"

"Not a word—and that's what worries me the most. Last year he talked a lot about him, and was so proud and happy in his coming success. This time he never mentioned him; but he looked—bad."

"What did he talk about?"

"Oh, books, business—nothing in particular. And he wasn't interested in what he did say. He was very different from last year."

"Yes, I know. He is different," sighed Maggie. "He's talked with me quite a lot about—about the way they're living. He does n't like—so much fuss and show and society."

Mr. Smith frowned.

"But I thought—Mrs. Hattie would get all over that by this time, after the newness of the money was worn off."

"I hoped she would. But—she doesn't. It's worse, if anything," sighed Miss Maggie, as they ascended the steps at her own door.

Mr. Smith frowned again.

"And Miss Bessie—" he began disapprovingly, then stopped. "Now, Miss Mellicent—" he resumed, in a very different voice.

But Miss Maggie was not apparently listening. With a rather loud rattling of the doorknob she was pushing open the door.

"Why, how hot it is! Did I leave that damper open?" she cried, hurrying into the living-room.

And Mr. Smith, hurrying after, evidently forgot to finish his sentence.

Miss Maggie did not attend any more of the merry-makings of that holiday week. But Mr. Smith did. It seemed to Miss Maggie, indeed, that Mr. Smith was away nearly every minute of that long week—and it was a long week to Miss Maggie. Even the Martin girls were away many of the evenings. Miss Maggie told herself that that was why the house seemed so lonesome.

But Miss Maggie did not participate in the gay doings, she heard of them. She heard of them on all sides, except from Mr. Smith—and on all sides she heard of the devotion of Mr. Smith to Miss Mellicent. She concluded that this was the reason why Mr. Smith himself was so silent.

Miss Maggie was shocked and distressed. She was also very much puzzled. She had supposed that Mr. Smith understood that Mellicent and young Gray cared for each other, and she had thought that Mr. Smith even approved of the affair between them. Now, to push himself on the scene in this absurd fashion, and try "to cut everybody out," as it was vulgarly termed—she never would have believed it of Mr. Smith in the world. And she was disappointed, too. She liked Mr. Smith very much. She had considered him to be a man of good sense and good judgment. And had he not himself said, not so long ago, that he believed lovers should be of the same age, tastes, and habits? And yet, here now he was—

And there could be no mistake about it. Everybody was saying the same thing. The Martin girls brought it home as current gossip. Jane was highly exercised over it, and even Harriet had exclaimed over the "shameful flirtation Mellicent was carrying on with that man old enough to be her father!" No, there was no mistake. Besides, did she not see with her own eyes that Mr. Smith was gone every day and evening, and that, when he was at home at meal-time, he was silent and preoccupied, and not like himself at all?

And it was such a pity—she had thought so much of Mr. Smith! It really made her feel quite ill.

And Miss Maggie looked ill on the last evening of that holiday week when, at nine o'clock, Mr. Smith found her sitting idle-handed before the stove in the living-room.

"Why, Miss Maggie, what's the matter with you?" cried the man, in evident concern. "You don't look like yourself tonight!"

Miss Maggie pulled herself up hastily.

"Nonsense! I—I'm perfectly well. I'm just—tired, I guess. You're home early, Mr. Smith." In spite of herself Miss Maggie's voice carried a tinge of something not quite pleasant.

"Yes, I'm home early for once, thank Heaven!" he half groaned, as he dropped himself into a chair.

"It has been a strenuous week for you, hasn't it?" Again the tinge of something not quite pleasant in Miss Maggie's voice.

"Yes, but it's been worth it."

"Of course!"

Mr. Smith turned diliberately and looked at Miss Maggie. There was a vague questioning in his eyes. Obtaining, apparently, however, no satisfactory answer from Miss Maggie's placid countenance, he turned away and began speaking again.

"Well, anyway, I've accomplished what I set out to do."

"You—you've already accomplished it?" faltered Miss Maggie. She was gazing at him now with startled, half-frightened eyes.

"Yes. Why, Miss Maggie, what's the matter? What makes you look so—so queer?"

"Queer? Nonsense! Why, nothing—nothing at all," laughed Miss Maggie nervously, but very gayly. "I may have been a little—surprised, for a moment; but I'm very glad—very."

"Glad?"

"Why, yes, for—for you. Isn't one always glad when—when a love affair is—is all settled?"

"Oh, then you suspected it." Mr. Smith smiled pleasantly, but without embarrassment. "It doesn't matter, of course, only—well, I had hoped it wasn't too conspicuous."

"Oh, but you couldn't expect to hide a thing like that, Mr. Smith," retorted Miss Maggie, with what was very evidently intended for an arch smile. "I hear it everywhere—everywhere."

"The mischief you did!" frowned Mr. Smith, looking slightly annoyed. "Well, I suppose I couldn't expect to keep a thing like that entirely in the dark. Still, I don't believe the parties themselves—puite understood. Of course, Pennock and Gaylord knew that they were kept effectually away, but I don't belive they realized just how systematically it was done. Of course, Gray understood from the first."

"Poor Mr. Gray! I—I can't help being sorry for him."

"Sorry for him!"

"Certainly; and I should think you might give him a little sympathy," rejoined Miss Maggie spiritedly. "You Know how much he cared for Mellicent."

Mr. Smith sat suddenly erect in his chair.

"Cared for her! Sympathy! Why, what in the world are you talking about? Wasn't I doing the best I could for them all the time? Of course, it kept him away from her, too, just as it did Pennock and Gaylord; but he understood. Besides, he had her part of the time. I let him in whenever it was possible."

"Let him in!" Miss Maggie was sitting erect now. "Whatever in the world are you talking about? Do you mean to say you were doing this for Mr. Gray, all the time?"

"Why, of course! Whom else should I do it for? You didn't suppose it was for Pennock or Gaylord, did you? Nor for—" He stopped short and stared at Miss Maggie in growing amazement and dismay. 'You didn't—you didn't think—I was doing that—for myself?"

"Well, of course, I—I—" Miss Maggie was laughing and blushing painfully, but there was a new light in her eyes. "Well, anyway, everybody said you were!" she defended herself stoutly.

"Oh, good Heavens!" Mr. Smith leaped to his feet and thrust his hands into his pockets, as he took a nervous turn about the room. "For myself, indeed! as if, in my position, I'd— How perfectly absurd!" He wheeled and faced her irritably. "And you believed that? Why, I'm not a marrying man. I don't like—I never saw the woman yet that I—" With his eyes on Miss Maggie's flushed, half-averted face, he stopped again abruptly. "Well, I'll be

(Continued on page 20.)

THE BUSINESS OF THE CHURCH

A SERMON BY REV. DAVID F. WARNER

> TEXT: "All authority hath been given unto me in heaven and in earth. Go ye therefore, and make disciples of all nations, baptising them into the name of the Father and of the Son and of the Holy Spirit: teaching them to observe all things whatsoever I have commanded you: and lo, I am with you always, even unto the end of the world." Mt. 28:18-20.

IT was in Detroit. The State Sunday school convention was on. There is a great banner over the street on which are these challenging words: "The Sunday School is out for business, or else it has no business to be out." That's solemnly inviting and demanding. But why don't the church forces all along the line catch up such a slogan?

Well, our text will help us to understand something of the urgent and solemn challenge of Jesus' last command. And here is the setting: The eleven disciples had gone into Galilee. Why? By previous appointment of the Master. It was not accidental or incidental. Now how fitting that "Galilee of the Gentiles", lowly and despised by the hide-bound Jews, should become the place that Jesus is to proclaim himself as not only King of the Jews, but of all nations! And they were to go unto the mountain where Jesus had appointed them. Probably the mountain from which He had spoken his great "Sermon on the Mount." We like to think of it in that way, for around this mountain had gathered many holy and tender associations.

And the circumstances must have been dramatic. The disciples are waiting and wondering. And when He whom they had known as so kindly and lowly; He, who had been killed and buried, now walks slowly down the mountain, and presents Himself in His royally glorified state, "they saw Him, they worshipped him; but some doubted." There is hesitancy and misgiving. Then he speaks in majestic strain, "All authority hath been given unto me in Heaven and in earth. Go ye therefore." And they understood. With what joy and surrender they go! And all the early church must have understood and believed. Justin Martyr, in 150 A. D., says, "There is not one single race of men, whether barbarians or Greeks, or whether they may be called nomads or vagrants, or herdsmen dwelling in tents, among whom prayers and giving of thanks are not offered thru the Crucified Jesus." The business of the apostolic church was the business of the King. Every individual was an evangelist.

"Go ye, therefore, and make disciples of all nations." This is the business of the church until all men are brought under the kingship of Jesus. "For He (Christ) must reign till He hath put all enemies under his feet." 1 Cor. 15:25. Reign where? Reign in the hearts of men. The authority given to Jesus Christ is no empty rule, but the supremest and profoundest surrender of life to Him. But it seems it needs Gabriel's trumpet to bring us to our feet in recognition. Jesus regarded his authority over men as a condition in which they would receive his spirit into their hearts, and make them the seat of his rule. The salvage of the nations depends upon a surrendered and willing church.

"Baptising them into the name of the Father, etc." There, now, says some one, "Just what does that mean? Well, this preacher is sure that it means some baptismal symbol that easily signifies that men are to be immersed into communion with the Heavenly Father. Of course we all live and move and have our being in him. We are floating in the measureless ocean of God's love. But many are so water-proofed, to speak figuratively, with the spirit of a God-defying, Christ-denying, and materialistic age, that the "water of life" can not get into the waters of God's bottomless love for every man. And it is the business of the church to bring nations to bathe in this Jordan.

But it is going so slowly. And why? Now, here it is in place to make some overtures that are more than guesses. First, the pulpit is yet reading sermons and devoting itself to adults. The demand of the day is not so much for measured sentences and symphonic style; but for plain, elemental convictions that come burning-hot out of heart-furnaces superheated by the fires of faith. But more than this, step into the average church today and you will find a preacher speaking to a handful of adults. Adults, who already know much more than they are willing to practice. Why should a minister go on in repeatedly unsuccessful attempts to get thru the worldly-thickened hides of these church grown-ups? Yes, the congregation is small. Where are the rest? You say. But why not turn to the children? The writer has a few minutes separate worship for his children every Sunday morning. Two weeks ago, twenty-one children surprised him by saying, "Pastor, we are all reading our Bibles every day." And you should hear them quote Scripture. Well, I put them on the honor-roll. Wouldn't you? Before me is a sunday-school convention program. One subject reads like this, "How to interest children in the church." And the speaker for the subject is a preacher who confessed to me the other day that his church is not doing it. How funny! Wouldn't you like to hear him tell how to do it? Let us cast our votes for deeds that will match our creeds. "A pound of deeds is worth a ton of creeds." Talk less; do more. Doesn't our text say, "Teaching them to observe all things"? "To observe"; that is, to do. But the old folks wont do it. It will cost too much. It means every little while a fat steer out of the stall, a hog out of the pen, and often your children leaving home to carry out their Lord's solemn commission. Let us reclaim the young life. Let us turn to the children. They are the hope of the world. But what will our Lord do with the preachers who are using up their time attending committee meetings, shining at banquets and social functions, patting church officials on the back, and on Sunday morning pull a stale sermon out of their "barrel" and read it to a small congregation of Gospel-hardened adults? What a shameful attempt to glorify the church's only business!

"Teaching them to observe all things." You see, the church is to Christianize the nations. But some one says that is impossible. It can't be done. But that end of it is not our business. Jesus said it could be done, and the church's business is to believe it and go at it in earnest. We are to mobilize for the attack and then advance. "Christianize the Bolsheviks and the Turks?" says someone. "It can't be done. Rather, we ought to wipe them off the face of the earth." But if it can't be done, we must cut the heart out of the last and greatest command of our Savior, and out of his statement, that "If I be lifted up I will draw all men unto me."

This is true; it can't be done until Christian nations give more attention to the Christianizing program. While the nations of Europe are jockeying for the balance of political and industrial power, Mohammedan Turkey is getting to her feet in defiance. Christianity is in the dust: Diplomacy rules. While the Turk's Koran prohibits the use of liquor, the one hundred per cent American, with his Bible, keeps booze in his golf locker and cellar. And so our Western Christianity with its liquor, cigaretts, and immoral films. And again, while the heathen is seeking for the true Jehovah, churches at home are quarreling over definitions of religion and tweedling with the real program of Christ. Of course it can't be done. May God have mercy on us!

But, it can be done. The church may have unlimited power when anything like unity, cooperation, and concentration, comes about. "I am with you always even unto the end of the world." This last promise and surety is a marvelous one. Not the taking of an abstract teaching to the world, but a gospel impregnated with a Life; a Life that has the power to raise humanity to Heaven's ideal of love and service. It can be done. Now, let us go. This is the church's business.

En-ar-co MOTOR OIL

THE OIL OF A MILLION TESTS

IN making En-ar-co Oils we average over a million tests a year. These tests are of every kind and cover every step of our Scientific Refining process.

Some of these tests are so accurate that they are timed with a stop watch, and their accuracy is a matter of split seconds.

That is why En-ar-co Motor Oil is endorsed by all of the leading motor builders and is considered everywhere the best to be had.

Try it in your motor! Drain out the old oil, put in fresh En-ar-co and you will at once notice a difference. You will have less trouble and less repair cost.

"The Farm Paper of Service"

WHO STARTED IT?

ACCORDING to current press reports there is a movement on foot at East Lansing to change the name of the Michigan Agricultural College and even acting-president Shaw is given credit for bringing it to public attention.

We take it that this means that some of those who are attending the agricultural college would rather have a more flossy name, a title which did not suggest so much Mother Earth and the wholesome problems of crop production and husbandry.

We take it that the title "Michigan Agricultural College" does not fit so well with some of the "sheiks" and "flappers," and that they would prefer to have a name for the old college, with so worthy a background, which would rhyme better in a song or college "yell."

"On what meat doth Ceasar eat—?" that this name, so long honored and by so many thousands now doing their work in the world, so highly cherished, should be the subject of discussion as to its fitness.

Even the great University at Ann Arbor can hardly point to a more distinguished alumni, than have come from the gates of M. A. C.

Then looking at it from the standpoint of the great agricultural industry in Michigan; is it not well that one institution should be dedicated both in name and in purpose to the pursuit in which more than one-half of the citizens of this commonwealth are daily engaged?

Frankly, it is our opinion that the Agricultural College in Michigan has been leaning too far towards the courses of study which are not directly leading towards an improved agriculture. That the courses are already treading on the toes of other institutions in this state which are devoted primarily to non-agricultural subjects.

The college at East Lansing ought to be just what it was founded to be, a "school for the upbuilding of agriculture." As such, it ought to attract to its gates the flower of our young men and women in this state. It ought to hold its head aloft from the antics of the modern schools, which are more proficient in teaching "Jazz dancing," than the subjects listed in their catalogs.

A movement to change the honored name of the Michigan Agricultural College, tho innocent appearing in itself, indicates, in our opinion, that there is something very fundamentally wrong at East Lansing. That it is deeper than the board, deeper than the acting head or his able staff of teachers—it rests down in the soul of the school which is the student body itself.

If the wrong type of students are being attracted in increasing numbers to the college, it is time to find it out. If the wrong studies are being given emphasis, it is high time to change the appeal. If the esprit de corps of the college has been mutilated by the changes and dissentions of the recent hectic years, before another semester opens is the time to eliminate the obstructionists, the sour-notes or the bolshevists.

Luckily for Michigan, the new president of the Michigan Agricultural College who takes over the pilot-house on September first, or thereabouts, is a man born with the love of the old college and all that its name implies in his very veins, with the fighting stamina of generations of pioneers back of him and his years at Amherst should have given him the rugged determination of the rocks along the coast of Massachusetts.

Once again, welcome home, Dr. Butterfield, the business farmers of Michigan to a man, are back of you and place in your hands the college which you know, and they feel, by every right belongs, campus, hall and dome to Agriculture!

THE ISLAND OF SAFTY

IN the current installation of Mr. Stanley Powell's series of articles on taxation in Michigan he aptly calls the tax exempt bond the "rich tax dodger's island of safety."

You have been hearing a lot recently about the danger of tax exempt securities and what they were doing to not only capital, which has heretofore been employed in the upbuilding of industries, but providing the funds for producer and laborer alike. If you will read the article in this issue you will have a clear conception of what is meant by the tax exempt bond and what effect it is having on economic conditions in the United States at the present time.

The danger of tax exempt bonds lies not only in the fact that it is an "island of safety for the rich tax dodger," but there is a pregnant danger in the ease with which cities, counties, and states officials spend this money for the improvements, some of which are not pressing. There is as much danger in "easy money" for the public official as there is for the individual. "Come easy, go easy," applies to official corporation or individual and limitless funds seem to be available for any and all purposes.

Tax exempt securities are so popular at the present time that they are actually in demand and as we have seen in the light of our recent experience with prohibition, where there is a human demand there is bound to be a supply forthcoming. So far our officials seem to have found enough absolutely necessary (?) improvements to keep the bond market well supplied and and the bond broker happy.

It might be wise to look over the platforms which will be spread before you by the two principal parties and see what they have to say about this live issue. There is probably no other one that comes any nearer to your pocketbook.

Read Mr. Powell's article in this issue if you want to know the facts regarding tax exempt securities; it is worth the while of every man or woman who votes.

PICTURES BY WIRE

HOW long ago was it that you marveled at radio and said "what will it be next?" Not so long, and yet the answer to your question is already forthcoming, for photographs are now being sent by wire and New York newspapers are printing pictures taken at the Cleveland convention five minutes before!

It pictures can be sent by wire, they can be sent by wireless! Pictures flying through space, invisible likenesses being transfered as silently as thought itself, what do you make of it? Had one predicted this a hundred years ago they would have been counted raving fools fit only for an insane asylum and more probably been publicly burned at the stake for their heresy.

Perhaps the day will come when one may travel as fast as light—buy a ticket, press a button and be in London or Calcutta or Hong Kong! "Crazy!" you say, "Impossible!" "Mere ravings!"

Don't say it for men are still living who said that man could never fly!

FLATTERERS!

BEFORE another issue of THE BUSINESS FARMER goes to press you are going to have an opportunity of reading in the daily press the complete platforms, as carefully erected for your approval, by the two conventions of the great political parties being held this month.

From indications to date, it is quite apparent that party leaders recognize the impending "disgruntled" farmer vote, which en mass, is something to be considered.

We predict that in each of the party platforms there will be a plank highly polished and covered with a veneer of varnish which will make it appear very new and real in its promises of relief to the present agricultural situation. We predict also that each of these planks will be about as solid as the paper on which they are written, and that irrespective of which great party landslides into victory this fall the great business of agriculture in America will be little affected by the people's choice.

One thing is quite apparent; the present condition cannot continue without a genuine upheaval, if that has not already happened, as we are sometimes prone to admit.

The politicians who have been in, and those who want to get in, are going to have to do a tall lot of explaining at home to the farmers of the United States whether they hail from Maine, California, Florida or Oregon. We would like to venture a further prediction that the results of this year's election are going to prove a mighty big surprise to Wall Street and some of the high financier's "dopesters." Some of these wise political astronomers who think they can read all of the signs in the sky and prophesy the outcome of this November election are going to be guilty of just one big blunder, and that is, that they guessed wrong.

If we knew how the political wiseacres were going to vote this fall we would take the other side with a fair chance of winning!

SERVING TWO MASTERS

IN the opinion of A. B. Cook, state master of the Michigan State Grange, the four members of the state board of agriculture who are also members of the board of directors of the state farm bureau, should resign from one office or the other.

This assertion is not made from a personal standpoint and has no reference to the present incumbents of the office, but is, according to Mr. Cook, directed at the continuation of such a policy.

There are several great farm organizations in Michigan and, fortunately, during the past few years they have buried the hatchets which were wielded with such vigor and so little effect in the bygone days, and today they are working shoulder to shoulder, to the everlasting good of the farming business in Michigan.

There is no question but what the members of the state board of agriculture should be members of one or all of the leading farm organizations in the state, but that they should hold executive positions in these organizations while serving the state is, in our opinion, a dangerous policy to say the least, and one which is bound to lead to complications and perhaps even jeopardize the, harmonious understanding among the various farm organizations as exists today.

Goodness knows that farmers have enough enemies on the outside without fighting among themselves, and an ounce of prevention at this time may save a ton or so of trouble in the future!

We agree with Mr. Cook that this is a subject well worth bringing to the surface and settling before more serious complications arise.

PRISON LABOR PAYS STATE

INMATES of Michigan prisons earned $3,588,013 for the state during the last fiscal year, according to a report made by the Department of Labor. The earnings are for only the prison industries, as the returns from the road work being carried on under direction of Gov. Alex J. Groesbeck have not yet begun to show up in figures.

Michigan is seventh in the number of men employed, sixth in the value of products manufactured for its own consumption, first in the value of goods sold, and third in the total value of products.

The state institutions worked 3,381 men as an average last year, producing $619,215 work of products for their own use and $2,778,433 for the market. The total was further augmented by $190,365 worth of labor on public works. It is worth noting that none of Michigan's earnings came from contract labor, in which the inmates are hired out to private contractors, and to which the abuses are charged which bring condemnation of prison labor. All of the work was done by the State itself. Kentucky and Alabama, the two commonwealths whose total value of products exceed Michigan's, hired out their prisononers in factories and coal mines.

Add to this showing the road-building program carried out in the last half of 1923 and the ambitious program for the current year and it would appear that Michigan has something to be proud of in the conduct of other-wise waste labor of its confined unfortunates. Lets keep up the good record!

Now is the time to ask the politician for anything you want. You may not get it, but he'll give you his promise to get it, if you'll only vote for him!

They can vote-down, veto or ignore, but there will never be permanent, lasting normal prosperity in these United States until agriculture prospers!

Time was when only part of the country quit work and went to the national conventions; now, the whole darned country sits around the livin' room a listenin' in!

PUBLISHER'S DESK

STANDARD FOOD AUD FUR ASSOCIATION IN COURT

THE Standard Food and Fur Association, a New York organization many of our subscribers have had dealings with, much to their regret, is now having its trouble. Five of the officials of the association were indicted and arrested. The charges in the indictments are using the mails in a scheme to defraud and indications at the present are that Uncle Sam will put them at honest labor for a while. And thus will end another plan to get something for nothing.

ONLY FEW OF LETTERS ARE PUBLISHED

WE wish that space in our editorial columns was not so limited so that we could give more space to the Publisher's Desk. The few letters or inquiries discussed in this department each issue are only "a drop in the bucket." Each and every letter received is answered by mail as soon as possible. As a rule we have the information wanted right here but many times we must conduct an investigation—not the kind that Congress starts but a real investigation to find out the facts—and as soon as we get the information needed we write our subscriber. At least 90 per cent of the letters answered by this department never appear in print, because we haven't the space. So we try to pick out the ones that we feel are of the most general interest and use them, but even at that there are many we should use that are never printed. If we could print more it would save us both work because many of our subscribers would find in the Publisher's Desk an answer to some question they had in mind and would not have to write to us and we in turn would not have to write the subscriber. But we are here to serve and if we are giving you what you want then we are fulfilling our purpose. We like to work so send on your inquiries.

DETROIT AERO METALS CORPORATION

THE inquirer requests to know if this stock is safe "investment."

The character of this stock is not sufficiently fixed to regard as being in the investment class. In other words, it is rather to be regarded as a speculation.

The present idea behind this Company is the manufacture of aluminum and aluminum alloy metals by new processes, which would greatly reduce the cost. The company is organized around the personality of Dr. G. Lenardo Williams, a chemist of German ancestry, who claims to have invented several new methods. Dr. Williams may be said to be unquestionably a man of much information and knowledge along chemical and metallurgical lines but there is a very great difference of opinion between scientific men as to the value of his methods theoretically, and his history would not justify a finding that his alleged methods have as yet been established in a commercial way.

In other words, it has been charged by men of reputation in the chemical and metallurgical field that Mr. Williams' theories lose practicability after they leave the laboratory. Many things are possible in a chemical laboratory, which, when transformed to commercial production, lose their validity, and this is principally the argument against Dr. Williams' processes, i. e., that he has never been able to reduce them to a practical commercial basis.

The Detroit Aero Metals Company is the last of a string of corporate adventures of Dr. Williams, which have been formed about him by enthusiasts to test his processes. The International Aluminum Company, which was organized and financed principally by Detroit capital a few years ago, dropped several thousand dollars and proved to be quite a fiasco. The company proposed to make aluminum and market it for a few cents a pound and it was also proposed to buy the Government Nitrate plant at Nitro, W. Va. The management of that company was such that the ultimate outcome cannot be said to have been decisive as to the practicability of Dr. Williams' processes, inasmuch as the management was under questionable origin and Dr. Williams can give a plausible explanation for the failure of that enterprise, which does not necessarily reflect upon the worth of his new processes.

The Detroit Board of Commerce is at present engaged in some controversy with Dr. Williams and with the Detroit Aero Metals Corporation, growing out of its publication, the Detroiter, of an article appearing in a scientific paper which berated Dr. Williams' ability, and charges and countercharges are being made by both sides and a suit for libel has been instituted in the Wayne Circuit Court.

Under all the circumstances, the stock is by no means an investment and a sufficient amount of the stock has been sold to enable the company to establish the practicability of Dr. Williams' processes beyond further delay.

INSURANCE AGENT MISREPRESENTS

I am going to tell you of a swindle by the ——— Mutual Fire Insurance Co. Three years ago their agent came to my house and sold me insurance for three years and I paid him the cash with the understanding that there would be no extra assessments on the policy. They have been after me for assessments they say I owe them. They claimed eleven dollars and some cents and I sent it to them last fall. At that time I returned the policy to them for cancelation. Last week they sent me a bill for $1.39 threatening to sue me if I didn't pay up. They have done this same thing all over this section. If it isn't swindling I'd like to know what it is. They say "Why didn't you look at your policy?" We didn't have any policy when we paid the agent and did not receive it until nearly a month later."—E. W., Iosco County, Michigan.

THIS is not an uncommon occurence as similar instances have been reported to us for some time past. The company referred to had agents canvassing the farmers offering them them a three year policy for a certain amount, leading the farmers to believe that the amount he was collecting would be all that would be required for the entire period of three years. Being a mutual company it was impossible to make any promises as to the costs for any specified period. A mutual fire insurance company comprises a number of people banded together to pay the losses of each other, also the expense of operation, and there is no telling in advance what such rate will be, and the agent representing that the amount paid was all that would be required was very ignorant of conditions or knowingly misrepresented the matter. Certainly the company should have prevented the agent from misrepresenting should it come to their knowledge.

The three year policy costs the members about twice the amount the agent said it would and caused great dissatisfaction, but the experiences of our subscriber seems to be only one of the many instances which has awaken the farmers to the fact that to promise a stated rate in the operation of a mutual insurance is impossible, and is bordering on obtaining money under false pretenses which in Michigan is a crime punishable by fine or imprisonment or both.

THANKS!

Dear Sir:—In yesterdays mail I received a letter from ——— containing a check for $29.06, this being the amount which they owed me. I want to thank you for helping me collect this, and also for your promptness. Yours truly, Mrs. A. F. L., Curran, Mich.

Dear Sir:—I am writing you in regard to claim No. 1450. He has settled with me so every thing is satisfactory. Thanking you for your kindness in looking it up for me, Respectfully yours, E. L., Birmingham, Mich.

We have not received our copy of the last issue of the BUSINESS FARMER, and would appreciate it very much if you would forward copy of that issue to us. We dislike to miss even the one copy. Thanking you for the courtesy, I am, very truly, C. V. L., Owosso, Mich.

First Mortgage Real Estate Gold Bonds

The confidence reposed in us by thousands of farmers is an asset we prize highly. You can count upon our first mortgage bonds always being well worthy of your trust.

Order Your Protective Service Sign Now

The Protective Service Bureau of The Business Farmer is now able to furnish its paid-in-advance subscribers a beautiful Protective Service Sign.

It is a high class sign in every respect, made up in two colors, red and black, on a white background, weather-proof, 5x11¾ inches in size, suitable for hanging on your fence, mail post, or other prominent place.

This sign will serve as a warning to crooks, fakirs, quacks, and grafters, to keep away from a farm which is affiliated with The Business Farmer Protective Service Bureau.

Only a few thousand of these signs have been ordered and we are going to mail them to our friends—first come—first served—at actual cost, only 25 cents. We already have had advance requests for hundreds of these signs—Fill in the coupon below, so as to be sure you get your sign before they are all gone.

THE BUSINESS FARMER,
Protective Service Bureau,
Mt. Clemens, Mich.,

( ) I enclose a dollar for a two year renewal and 25c for a Metal Sign and certificate.

MEMBER
The Michigan BUSINESS FARMER
PROTECTIVE SERVICE BUREAU

5x11¾ inches Red and Black on White Background

( ) My subscription is paid to 1925, so I enclose 25c for a Metal Sign and certificate.

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

DEAR FOLKS:—Are the members of your family getting the various foods they ought to have to provide the necessary heat and energy, to make for growth, provide strength and care for the regulatory needs etc? For growth, strength, regulatory needs and health milk is the leading food and a normal child should drink a quart a day while an adult needs a pint or more. A normal person should eat eggs at least three times a week. Fruit should be eaten twice a day or oftener and two or more vegetables besides potatoes, and including leafy vegetables once day. Starches, fats and sugar should be taken according to the individual's activities and needs. And water is an absolute necessity; at least 8 glasses a day. Why not check up on this matter? You may be able to improve the health of your family.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

LIFE

WHAT is it this sad, old world of ours needs,
With it's various customs, habits, and creeds.
With it's well-trodden paths and walks of life
Beset with temptation, hardship and strife?
A little more sweetness to brighten the way
Of the dear ones who live with us each day.
Add a mixture of patience and charity
To life all around us and we shall see,
That our lives will accord in sweet harmony.
Use a little more love and sympathy,
A little more kindness to banish the sorrows,
It will gladden and strengthen the many to-morrows.

—Inez G. Corbin.

GROW YOUR OWN HEALTH TONICS

THE use of fresh vegetables and fruits is an insurance against sickness. Here is another idea which should stimulate interest and encourage more people to raise more vegetables and fruits.

Dr. J. G. Richardson, professor of hygiene at the University of Pennsylvania, assisted by a number of physicians in this and other countries, has published a book entitled "Health and Longevity." It is interesting to note that the following vegetables and fruits were included in the list of medicinal plants:

Asparagus—Gently stimulates the kidneys.

Beets—Relieves gravel and readjusts certain internal disorder of women.

Carrots—For kidney complaint; used for poultices; powdered seed relieves colic promotes secretions of the kidneys; laxative.

Celery — Good for rheumatism and neuralgia.

Cucumbers—For clear complexion.

Cranberries—Taken as relief from piles; also relieves nervous breakdown called hysteria.

Garlic—For worms, whooping-cough, stomach and intestional trouble.

Horse radish—Tonic for digestion; produces secretions of the kidneys; syrup cures hoarseness; tea said to benefit neuralgia and rheumatism.

Leek—Poultice for bronchitis and chronic coughs; taken for worms and whooping-cough, also stomach and intestional trouble.

Navy beans—Relieves erysipelas when poultice is applied to the affected parts.

Onion—Promotes digestion; acts on the liver by increasing the secretion of bile; cure for constipation; poultice for bronchitis and chronic cough; taken for worms and for whooping-cough, intestional trouble.

Pepper—Cayanne tea used for grippe and scarlet fever.

Parsley—Hot infusion made from one ounce of fresh root drunk freely increases secretion of urine in case of dropsy and relieves women's complaints. Lotion is good skin beautifier.

Pumpkin—Good for tape worms, retention of urine, and inflamation of bladder and bowels.

Rhubarb—Purgative and laxative.

Spinach—A skin beautifier.

Strawberries—Lotion used as a skin beautifier.

Tomato—Cure for cholera infantum; now used instead of orange juice by some physicians for infants; sliced tomato rubbed on skin is good for freckles and sunburn.

Watermelon—Clears skin.

We do not guarantee any of these to be sure cures, but we do know that nature manufactures health producing substances and presents them to us in numerous fresh vegetables and raw fruits. It is also much cheaper and more pleasant to prevent disease than it is to cure it.

Remember that "an apple a day keeps the doctor away." Note—The apple must be eaten.

PRESERVATION OF OUR NATIVE WILD FLOWERS

THE bright warm days of spring call us to the woods, to hear the birds singing as they build their nests, and to gather the wild flowers as they peep out through the dried leaves. But each year the woods are a little farther away, for the growing towns are rapidly claiming the wooded districts for building sites; and each year the flowers are fewer, because they have been picked and uprooted in such large quantities, the preceeding spring.

The automobile makes it possible for more people to go to the woods but it also presents a privilege which is greatly abused. It is a deplorable sight to see car loads of people rushing home after a Sunday jaunt, with hands full of wilted wild flowers, most of which will never be revived.

At the present rate of annual decrease, one might safely prophesy that the next generation will have practically no wild flowers to enjoy. Many species that formerly abounded in the woods of Michigan, are almost extinct; the trailing arbutus is found only in the extreme northern part of the state and the moccasin flower is very scarce, for it will not thrive when its environment has been disturbed.

What can be done to preserve the few hardier species that still remain; the violets, trilliums, buttercups, blood-roots and hypaticas? There are two ways in which wild flowers can be protected; one is through legislation; to forbid the picking of all wild flowers, similar to the protection that is given to wild game, fish and birds; another would be through nature study in the schools, and by creating public sentiment, to stimulate an appreciation for wild flowers in their native haunts, where, undoubtedly, they are at their best.

The second plan would be the happier, more democratic way to handle the problem. Can we, of a supposedly highly cultured nation, not acquire the finer appreciation of nature, that the Japanese possess? Can we not go to the woods and enjoy seeing the wild flowers grow and be content to pick just the few which we can take home and care for? Or must we go on ruthlessly plundering, the woods of their treasures, until the time will come when, in the woods, we will be confronted with signs of "Do not pick the flowers" as we are today in the public parks, by "Keep off the grass."—Winifred S. Gettemy, Assoc. Prof. of Related Arts, M. A. C.

DISH WASHING MADE EASY

DISH washing, the bane of many a housewife, is really a delight if properly managed. Begin while preparing vegetables by emptying, rinsing and drying the paring pan and knife. After food is cooked, wipe any lids which are simply dripping with steam and place in the rack. Put cold water in all cooking utensils. If any are scorched or burned, add a teaspoonful of sal soda, or a tablespoonful of baking soda to the water and set them on the back of the range, or on the burner turned low.

When clearing the table, use the crust from a slice of bread to wipe all food which may be left on plates (a knife scratches nice china). Rinse out cups, sauce dishes and vegetable dishes by pouring hot water in one and emptying it into the next until all are treated. If this practice is followed there will be no "thick" dish water and no rim of grease around the pan.

Always have two dish clothes and two dish towels—one for glass, china and silver, the other for pans and kettles. Use hot rain water and naptha soap for washing and rinse well with hot water.

Wash glass ware first, rinse in soft water if possible and polish at once. Next wash silverware and polish without rinsing. It will shine better.

Wash and rinse china and while drying it, let dish pan set over heat.

Empty and scrape cooking utensils—now an easy task—change dish clothes and wash last. Also change towels, scald and dry.

I hope this will prove helpful to some house wives, young and old, for I am personally acquainted with some who have grown old in the service who have never learned system in any line of their work, especially dish washing. I wish that girls might learn such lessons before becoming housewives.—B. O. R.

HOUSEHOLD HINTS

If you use an oil-stove and should turn a burner too high that you cannot turn down again, throw a handful of salt on the flame. It will go out at once.

To prevent a rocker from moving along on a carpet when rocking, paste a narrow strip of old velvet on each rocker.

When patches of grime appear on a light-colored wallpaper, you can often get the marks right out by rubbing—lightly at first—with a small ball of dough to which a few drops of strong amonia have been added.

Scorched flannel can be restored to its original state by rubbing the stain with lemon and leaving the pulp on it; place in the sun for a couple of hours and wash in the usual way.

Save your ham, rice, macaroni and vegetable water for soups.

Personal Column

Who Can Answer This?—I would like to have this letter in print. In M. B. F. in August, 1921, I read a recipe for sliced cucumbers for winter use. It was signed "L. A. W., Osceola Co." and was as follows: "Peel and slice large cucumbers. Place in a weak brine of cold water and salt for 4 or 5 hours. Drain and fill glass cans with the slices nearly to the top; cover with cold cider vinegar and seal. If vinegar is very strong weaken with a little water." We tried this recipe one year and had good results. We put up some last fall and we found on opening them last winter and this spring that they were all soft. We would like to know what the trouble was.—Mrs. J. A.

—if you are well bred!

The Knife as a Table Implement.—The knife is not used: to mash or mix food on the plate; to scrape up food or gravy; to dip up salt from a salt cellar. Nor is it wiped, during a meal on an improvesed bread towel, nor employed to raise drops of gravy or bits of food which may have fallen on the table cloth or clothes. Parsnips and potatoes should never be buttered with the knife. The knife never carries food to the mouth. It is used only to cut food. It is always held in the right hand, with the index finger extending down the upper side of the blade. One mouthful cut and eaten at a time is an elementary knife rule. To avoid accident the knife should always be held in a firm grasp, and it must be as noiseless in its operation as fork and spoon. When not in use it rests on, not against the plate, like the fork. Since the knife is never used to place food in the mouth, there are no "knife foods" properly speaking.

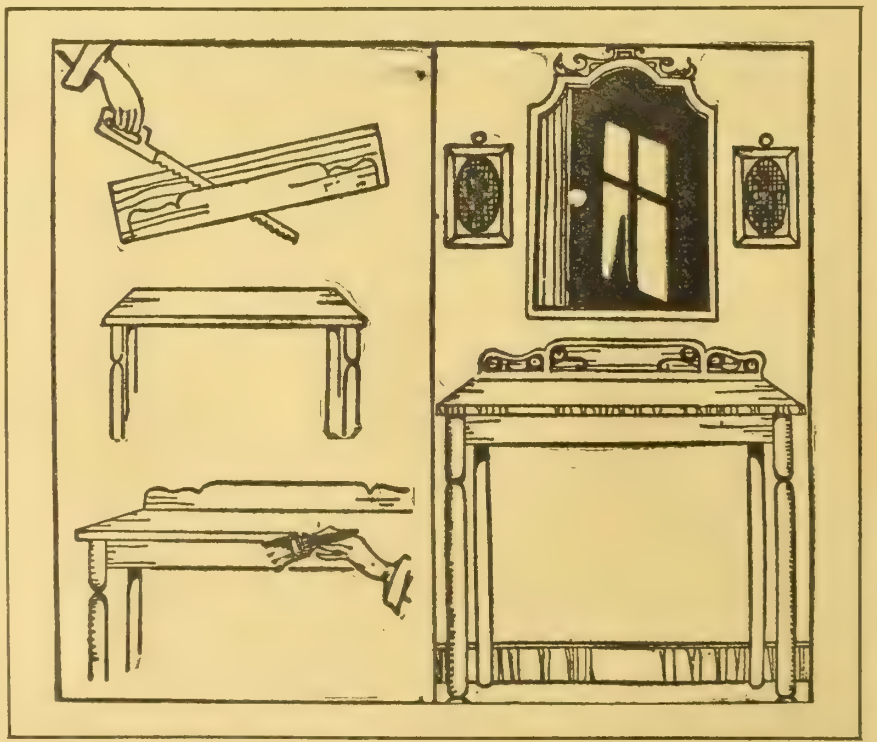
Menu for June 21st

Fried Spring Chicken, Milk Gravy
Mashed Potatoes Asparagus
Tomatoes Mayonnaise
*Rhubarb Fanchonettes
Coffee

***Rhubarb Fanchonettes** 2 pounds hrubarb, 1 cup sugar, ½ cup strained orange juice, 1 tablespoon powdered gelatine, 1 piece orange peel, 1 cup cream, whipped, flavored and sweetened, number of individual pastry shells.

Cut rhubarb into inch pieces. Hot house variety needs no peeling. Place in baking dish in layers, sprinkling sugar between layers. Add 2 tablespoons water, 1 tablespoon fat, and a few thin strips orange peel, place in moderate oven, cover and bake 1 hour. Dissolve gelatine in orange juice and when rhubarb is cooked remove it from oven and add this mixture to it. Let it get cold. When ready to serve fill shells with rhubarb mixture, heap with whipped cream and decorate with crystallized orange peel.

Paint Transforms a Kitchen Table



A small kitchen table may be converted into a serving table for the dining room by enameling all surfaces and attaching to one side a strip of wood that has been carved and stencilled with a conventional fruit design. To secure the best results, a coat of paint is applied first, and allowed to dry. Then a coat of enamel is applied and, when dry, is followed by another coat. A blue enamelled table, stencilled in golden oranges or purple grapes would be very effective against buff or light yellow painted walls.

RECIPES

Raisin Nut Bread.—1¼ cups entire wheat flour, 2 cups bread flour, 3 teaspoons baking powder, 1½ teaspoons salt, ¾ cup sugar, 1½ cups milk, 1 egg, 1 cup seedless raisins, no shortening.

Date Nut Bread.—2¼ cups entire wheat flour, 3 teaspoons baking powder, 1 teaspoon salt, 2 tablespoons fat, melted, ½ cup chopped nuts, ¼ cup sugar, 1 cup milk, 1 egg, ½ cup dates, fine cut and floured.

Nut Bread No. 1.—2¼cups flour, 3 teaspoons baking powder, 1 teaspoon salt, ¾ cup brown sugar, 1 cup milk, 1 egg, ½ cup seedless raisins, ½ cup chopped nuts, 1 tablespoon fat, melted.

Nut Bread No. 2.—4 cups flour, 1 cup milk, 6 teaspoons baking powder, 1 cup chopped nuts, 1 teaspoon salt, 1 cup sugar, 1 egg.

For the four loaf breads listed, mix dry ingredients. Add milk, well beaten egg, melted fat, the nuts or fruit. Put in greased pan. Allow 15 minutes for bread to raise. Bake in hot oven 45 minutes to one hour.

Drop Biscuit.—2 cups flour, ¾ cup milk or water, 4 teaspoons baking powder, 2 tablespoons fat, ½ teaspoon salt. Mix dry ingredients. Cut in fat. Add liquid. Drop into oiled pan. Bake 10 to 15 minutes in hot oven.

Drop Cookies.—1 cup sugar, ½ cup melted butter, 2 eggs, ½ cup milk, 2 cups flour, 3 teaspoons baking powder, 1 cup chopped raisins and nuts, 1 teaspoon vanilla. Mix same as for plain muffins and drop from spoon on greased pans. For spiced cookies, omit vanilla and sift with the flour, one teaspoon cinamon, ½ teaspoon allspice, ¼ teaspoon cloves, or ½ teaspoon ginger and 1½ teaspoons cinnamon. For chocolate cookies, add 3 squares of melted chocolate. Chopped peanuts may be used in place of raisins and nuts.

Plain Cookies with Ammonia—Sugar 2 cups, butter or shortening 1 cup, milk 1 cup, carbonate of ammonia ½ oz. flour 1 qt. (3½ cups). Pulverize the ammonia and mix with it the flour, and in the butter well, then the other ingredients; use only flour enough to handle (not stiff) roll thin and bake in a suitable oven—in fact all cookies require quick handling and a quick oven.—Mrs. C. D. C.

cup cooked oatmeal, ¼ cup sugar, ¾ cup cup cooked oatmeal, ¼ cup sugar ¾ cup raisins, ¼ teaspoon soda (scant measure), 2 teaspoons baking powder, ½ teaspoon cinnamon, 3 tablespoon fat, ¼ cup molasses. Heat the molasses and fat. Mix with all the other materials. Bake in muffin pans thirty minutes. This makes twelve cakes.

The Runner's Bible

(Copyright by Houghton Mifflin Co.)

He that goeth about as a talebearer revealeth secrets; but he that is of a faithful spirit concealeth the matter.—Prov. 11-13.

The malicious talebearer is an anomaly in nature. All other animals which thrive upon corruption because they devour it, are benefactors. But through the scandalmonger, corruption is nourished and increased a thousand fold. The one who has the love of God in his heart never discusses the errors and sins of another; on the contrary, he does his best to conceal and to destroy them.—(Luke 6:31; Ps. 32:1.)

In Hiding

Woman Customer (after the tired assistant had pulled down blanket after blanket until there was only one left on the shelf): I don't really want to buy a blanket to-day. I was only looking for a friend.

Clerk: If you think he's in the other one, madam, I'll gladly take it down for you!

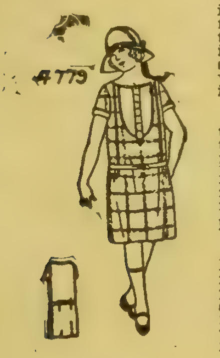
AIDS TO GOOD DRESSING

BE SURE AND SEND IN YOUR SIZE

4773. A Dress with Slenderizing Lines.—This model is very attractive for stout figures. The closing is at the side. The sleeve puff may be omitted. One could use crepe for this style in any of its pretty weaves, or linen. The new alpacas are also good for this dress. The Pattern is cut in 7 Sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 4½ yards of 40 inch material, and 1⅛ yard of figured material, and 2⅝ yards of plain material 40 inches wide. The width of the skirt at the foot is 1⅞ yard.

4767. A Seasonable Style.—Here is a pretty model for bordered materials, printed voile or georgette. It is also attractive for linen, wash silks and pongee. The blouse may be finished in either of two lengths, and with the sleeve short or in wrist length. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 6⅝ yards of 32 inch material. For the Blouse with short sleeves and in short length 1¼ yard less will be required. The width of the skirt at the foot is 2 yards.

4770. A Pretty Sports' Frock.—Figured crepe in red and black is here combined with black satin. This is a good style for alpaca, moire, ratine and linen. The sleeve may be made in wrist length, or short without the peasant portion. The Pattern is cut in 3 Sizes: 16, 18, and 20 years. An 18 year size requires 4⅝ yards of 32 inch material. For facing on yoke, skirt and girdle of contrasting material 1⅛ yard 40 inches wide is required. Without long sleeve portions ½ yard less material is required.



4779

4779. An Up-To-Date Style for the Growing Girl.—Plaid alpaca combined with plain alpaca is here shown. This model is also good for linen, flannel, pongee and ratine. The closing is under the box plait on the vestee. The Pattern is cut in 4 Sizes: 6, 8, 10 and 12 years. A 10 year size requires 2¼ yards of 32 inch material. For vestee and cuffs of contrasting material ⅝ yard is required.

4784. A Comfortable Slumber Garment.—Attractive and convenient is the model here portrayed. Crepe, nainsook, batiste, flannel or flannelette are good materials for this style. The Pattern is cut in 5 Sizes: 6, 8, 10, 12 and 14 years. A 10 year size requires 3¼ yards of 36 inch material. The garment may be finished with straight lower edges or, be gathered in knicker style.

4766. A Dainty Frock for a Little Girl.—Batiste or voile would be nice for this style. It is also pleasing in crepe and tub silk, taffeta and pongee. The Pattern is cut in 4 Sizes: 1, 2, 3, and 5 years. A 3 year size requires 1¾ yard of 27 inch material. To trim with contrasting material as illustrated requires ½ yard of material 27 inches or ⅜ yard 36 inches wide.

4783. A Popular "Base Ball" Suit.—Linen, drill, flannel, or khaki could be used for this design. The trousers are separate from the waist. The Pattern is cut in 4 Sizes: 8, 10, 12 and 14 years. A 12 year size requires 3½ yards of 36 inch material. The Cap alone requires ⅝ yard.

4759. A Pretty Skirt Style.—Here is a model that is very attractive for crepe, crepe de chine, voile or chiffon. The drapery may be made of contrasting material. The Pattern is cut in 6 Sizes: 25, 27, 29, 31, 33 and 35 inches waist measure, with accompanying hip measure, 35, 37, 39, 41, 43 and 45 inches. The width of the skirt at the foot is 1⅝ yard. To make this style for a 31 inch size requires 3½ yards of 40 inch material.

No Odor
No Wicks

No Noise
No Smoke

Make every meal delicious with a Vapo Oil Range

Cooks with an odorless, smokeless flame just like a gas stove

The Vapo Range operates like a gas range because it burns gas. It has all of the conveniences of the gas stove and all its cooking qualities. The marvelous Vapo Burner converts the kerosene into gas and burns it with a hot, blue flame that neither smokes or smells. Turned on at full heat, it will operate from 32 to 36 hours on one gallon of kerosene. At a simmering heat, it will burn from 50 to 60 hours. That is real economy.

Vapo Bolo oven bakes and roasts like a gas stove

The cabinet types of Vapo Ranges have a built-in Bolo Oven—a feature found only on the Vapo. The adjustable Bolo plate will make the oven big or little. Bolo means "Big or Little Oven." This makes a more intense heat because it is confined in a smaller space. You can do slow and fast baking at the same time.

Vapo is the only oil stove oven thatoffers you this advantage.

Vapo insures cooking comfort

Vapo construction includes many details which make for cooking comfort. The cooking top is roomy enough to prepare a large meal without crowding. The high shelf does not interfere with use of a wash boiler on the top and yet is not out of reach. The range is the right height to prevent back strain. Bolo oven doors drop to form shelves when needed. The oil tank is placed right for easy filling and the range sets flush against the wall. A range to treasure and be proud of. Have your dealer show you a Vapo.

Use the coupon for free booklet

Vapo Oil Ranges, Heaters and Water Heaters are sold by one high grade hardware or furniture dealer in nearly every community. If your dealer has none in stock. Write us, giving us his name and we will see that you are supplied.

MY ROVER

Florence E. Marshall

WHEN my upper lip is trembly,
And a lump gets in my throat,
And the fellows that I'm scared of
Have tried to get my goat;
And I'm feeling kind of lonesome
And I'm losing all my sand,
It's great to have my Rover
Come up and lick my hand.

For Rover is my buddie,
And I'm happy as can be
For I know there's simply nothing
That he wouldn't do for me;
For he loves me, and I know it,
And though other friends may fail
This world looks good, I tell you,
When Rover wags his tail.

You couldn't keep discouraged;
You couldn't long be blue
If you have a friend like Rover,
And know he's loving you;
For he rushes out to meet me
When I'm coming through the yard;
He just wags himself all over
'Cause he's loving me so hard.

DEAR girls and boys:—Not long ago a scientist had a large glass tank built with a glass partition through the center. He filled the tank with water and on one side of this partition he placed a large fish while on the other side he placed some gold fish. The large fish saw the gold fish and started for them, intent on devouring them, but he was stopped when he came to the partition. He struck his nose quite hard and hurt it but he was not to be disappointed so easily and he tried again and again to get at the little fish but each time he was stopped the glass partition which he could not see. After a few days he stopped trying to get the other fish and swam about in his half of the tank. About a week later the scientist removed the glass partition and all of the fish mingled together but no matter how close the gold fish came to the large fish he would not pay any attention to them.

Many of us are no better than this large fish. We try to do something and we fail; maybe we try again or maybe we are discouraged and say "Oh, my no! I couldn't do that. I tried it once and I know I couldn't." Don't be a "poor fish." Just make up your mind it can be done and you are going to do it AND THEN DO IT. Success comes in cans, not can'ts.—UNCLE NED.

OUR GIRLS AND BOYS

Dear Uncle Ned:—I thought I would try to join your merry circle. I am staying in Michigan but my home is in Canada and we live about 300 feet from the Welland Canal, and about 9 miles from Niagara Falls which is a very pretty sight to see; the whirl pool and the water rolling down looks fine. Have you ever been there, Uncle Ned? It is sure worth seeing. Well I must describe myself. I am 5 feet 9 inches tall weigh 174 pounds, blue eyes, fair hair and light complexion, My age is 17 and will be 18 on the 26 day of June. Have I a twin. I wish some of the boys of my age would write to me. I will answer all letters I receive. I will take a guess at Mary Zeets age, she is 15 years old. Well I will close now. Your friend,—Earl Running, Filion, Michigan.

—Even though your home is in Canada, Earl, you are welcome to our circle. It must be very beautiful around your home and I know the girls and boys would like to hear more about it.

Dear Uncle Ned:—May I join your Children's Hour? I have been reading the letters and thought I would write. I enjoy reading letters. Maybe I will see one of mine in print. I will describe myself as the others do. I have light brown, bobbed hair and gray eyes. I am four feet two inches tall, and weigh 71 pounds and am 11 years old. Now I guess you can tell how large I am. As my letter is getting long will close. From a would-like-to-be niece,—Marian Wines, Adrian, Mich.

—Come again Marian.

Dear Uncle Ned:—May I enter your merry circle? My step-father takes the M. B. F. and I read the Children's Hour. I live on an 80-acre farm. We have 2 cows, 2 calves, 3 dogs, 1 cat, 19 pigs and 23 little chicks. I have one sister, two brothers and my sister is in the first grade at school, and I and my biggest brother is in the seventh; he is 14 and I am 12. Now I hope this letter does not reach the waste basket. Well I guess I will have to close hoping to get a letter from some of the boys and girls. I will answer all letters received. Your want-to-be niece,—Margaret Marford, Gould City, Mich., Box 75.

The Children's Hour

Dear Uncle Ned:—Well I think I will try to write again, I wrote once before and I guess my letter must have found its way to the waste basket. I wish you would move it a little farther away so this one won't get into it. I live on a farm and I think I would like to live in the city too. But I like the cows, chickens, and horses. I have a dog and some kittens too. We have two of the cutest little calves; ones name is Betty and the other one is Michigan. I like the names. Do you? Your want-to-be niece,—Dorothy Marion Hartsell, Gagetown, Mich., R3.

—Oh Dorothy, how could you live on the farm and in the city too? Are you twins?

Dear Uncle Ned:—I have never written to you before. We take your paper and like it very much. The first thing I turn to is the boys' and girls' page. Well I guess I will describe myself. I have medium brown hair (of course it is bobbed. Ha! Ha!) I am five feet two inches in height. Do any of you boys and girls like to go to school? I do. I think it is lots of fun to go in the summer. In the winter time we have hot dinners. I live on a 160 acre farm. We have 4 horses, 20 head of cattle and a shepherd dog. For pets I have 2 little kittens. One is Trixie and the other is Rosebell; they are very cute. We have about 200 chickens, 17 turkeys and 18 pigeons, we also have three pigs. I live with my parents. I have two brothers and two sisters. I hope some of you boys and girls come to Summit City this summer. I think we would have a pleasant time, don't you? I will give you a riddle to answer. The one that answers it will receive a letter from me. Here it is: On the hill there is a green house, in the green house there is a white house, in the white house there is a red house, in the red house there are many little black niggers. Guess it. My letter is getting quite long so I will ring off. Your affectionate niece, —Anna Bretanus, R. 1, Box 41, Summit City, Michigan.

Dear Uncle Ned:—I am 12 years old, 5 feet 1 inch tall and am in the 8th grade. I have light hair, of course it is bobbed, and blue eyes. Say Uncle Ned, don't you think it would be nice to have each boy and girl write a description of how they picture you and see which could come the closest to what you really look like? Of course, my ideas aren't very bright and you will probably not even think it over. Say, in your last issue I see you ask if we are all going to follow in our mothers footsteps. Uncle Ned, although I love the farm, I am not going to live on a farm if I can help it. I may live on a farm but my business will not be farming. I am going to be a dancing instructor if I can. My mother does not like my future idea very well. Here is my idea of Sprng.

Spring is the time to be lively and gay,
The time to have good seed to sow.
If you will sow them, you'll surely get pay,
Before another winter brings cold wind and snow.

Your want-to-be niece,—Ilene Wingard, Cedar Springs, Mich., R. L.

—If you love the farm you certainly should live there all your life, but if you are going to be a dancing teacher I expect you will have to live in the city. I'll just bet you soon get tired of living in a dirty city, with no door yard or a chance to get the fresh air.

Dear Uncle Ned:—I surely hope I am not too late to enter the "scramble" as I dearly love to corrrespond with other young folks. I have a plan, here it is. Why not let all the cousins when they write to you enclose a few cents in stamps and let you (Uncle Ned) exchange it for money and call it the Children's Fund, then you could send the money to some crippled child. What do you think of the idea, cousins? Let's hear your opinion of it. I think it would be great fun. Uncle Ned, have you ever had diphtheria? I have just got over having it. Two of my brothers and my sister also had it. we are all better now. I am enclosing a poem you may print if you like. Well as my letter is getting long will leave room for other cousins. Hoping this escapes the waste paper basket. I am your loving niece,—Helen Goodrow, Hale, Mich.

The Violet

What a pretty wild flower,
Is the violet blue.
And when there is a rain shower
It will bloom so true.

It grows out in the woods,
Where many people go.
Children like to gather them in their hoods,
As long the path they go.

It blossoms in the spring
When the sun is shining bright.
Then the birds will sing,
As they see the violet in the morning light.

—By Helen Goodrow, Hale Mich.

—You are quite a poetess, Helen, and I can see you love flowers.

ETHEL, THE BELLE AT THE BALL

It is getting dusk, the lights are shining brightly at the Gilbert Castle.

The automobiles are beginning to drive into the yard, for there is to be a large ball at the Gilbert's.

Ethel, a beautiful girl of 17, is in her room, she is standing by the window watching the cars as they drive up the beautiful avenue. If once you looked at her handsome face and form, you would never forget it.

She has brown hair, beautiful brown eyes which are snappy, but at times are sad and affectionate.

As the last car drove up the avenue she slowly walked to the dresser arranged her hair more beautiful, descended the stairs and entered the ball room. A large company of young men and women were standing by the piano.

As Ethel entered the room, Maggie, her affectionate friend, came forward toward her and said, "Oh! Ethel I am so glad you have come." Ethel smiled sadly and slowly put her arm around her and Maggie said, "Come Ethel, we were all waiting for you, will you not play a piece for us."

They walked to the piano together, her friends greeted her kindly, and as she set on the piano stool she said, "What song do you prefer girls?"

Gay Gilbert, a handsome young man, who was deeply in love with Ethel said; "Play 'there is only one Pal after all.' "

As Ethel placed her beautiful fingers on the keys, the notes came loud and clear, and all sang but Ethel who was too sad to sing.

Soon the dancing began and all danced and had a fine time. At midnight there was to be a large supper and after supper the prettiest girl there was to become the wife of Gay Gilbert.

Midnight drew near, all ate the feast and then the people were to decide who was to be the Belle of the Ball.

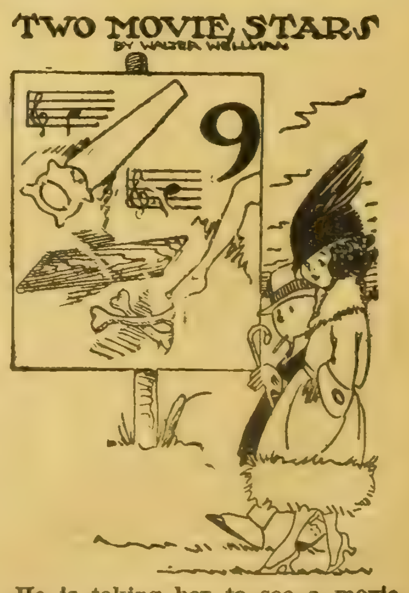
Ethel was setting on a large davenport with a company of boys and girls. They all decided that Ethel was the Belle of the Ball.

She was slightly blushing for Gay was coming toward her.

The inner light from her soul was shinning in her eyes, she loved Gay very much, but did not want him to know it. She had known him for several years and loved him ever since the first time she met him. Now he was to be her husband. Oh! how her heart ached for him.

As he stood before her their eyes met, her eye-lids dropped for she could not bear his searching gaze.

'Ethel!" and he clasped her to his bosom, "You are mine, all mine dear, body and soul," and also "The Belle of the Ball."—Miss Margarch Jackowish, Sherwood, Mich.



He is taking her to see a movie show, and she has just mentioned the names of her favorite female stars. Their initials are "G. S." and "B. D.".. What are their names? Using all the letters needed to spell the names of the seven objects, see if you can form the full names of the stars? Who are they?

Answer to last puzzle: OSTRICH.

The Dear Little, Merry Little Sailor

EVERY day the Little Boat danced into the harbor of the Blue Sea.

And every day the dear little, merry little sailor waited for passengers. He waited and waited and waited!

But the passengers never came.

Oh, yes, there were plenty of passengers. Hundreds and hundreds and hundreds of them!

But they never blinked an eye at the Little Boat. Bless you, no!

They all hurried towards the Great Big Boats, as fast as they could!

And, after the Great Big Boats sailed away, the dear little, merry little sailor lifted his anchor and off he and the Little Boat would glide. Just as if the Little Boat were full of passengers.

"I will play at being prosperous and happy," he laughed, waving to the sea gulls. "And perhaps tomorrow I shall have passengers."

So the next day, the dear little, merry little sailor took the Little Boat to a most conspicuous spot, and whistled as loud as he could, hoping to attract the crowd.

But they never even glanced toward the Little Boat. They just fell pell-mell over each other to get to the Big Boats.

After the Big Boats floated away, the dear little, merry little sailor squeezed back the tears, and lifted the tiny anchor and sailed off. And, whistled, whistled, whistled!

"Well, tomorrow I shall have a passenger. I feel it in my bones," he sang to the blue skies.

And sure enough, he did feel it in his bones. Bless you, yes!

For when he and the Little Boat were waiting, waiting, waiting, he heard a shrill little laugh behind him.

Looking around he saw a little, funny old woman.

"May I take passage on your boat?" she creaked.

"Indeed, you may," answered the dear little, merry little sailor, trying to hide the great joy singing in his heart. At last he had a passenger.

"But," whimpered the little, funny old woman, "I have no money!"

His dear little, merry little heart sank. Oh, no money! And his was nearly gone, too!

But he shrugged,

"Oh, that doesn't matter. I'd love to have you on my boat!" and he began whistling, whistling, whistling.

So the little old, old, old woman hobbled onto the boat, leaning on a creaky old cane.

The dear little, merry little sailor whistled louder than ever to keep up his courage. And he offered the little old passenger a loaf of bread.

He did not tell her it was his last loaf. Bless you, no! He just whistled a little louder!

But, when the Little boat was 'way, 'way out to sea, a queer thing happened. Oh, indeed it was very, very queer! The Little Boat started getting bigger, bigger, and bigger.

"Oh, oh, oh," wondered the little sailor. "Look at my boat. It's swelling!"

"Oh, no, it's simply growing," sniffed the little old woman. Look, isn't it beautiful!"

And sure enough, it was beautiful. Oh, so beautiful and big! As beautiful and big as the boats that got all the passengers.

"Oo'oo!" laughed the dear little, merry little sailor. "How strange!" And his little eyes were wide with delight. Some way he knew it was the kindness of this queer little old passenger.

But when he turned to thank her, she was, oh, could it be true, a lovely young girl-fairy!

The dear little, merry little sailor teased for a reason for all the glad things about him.

"You see," the girl-fairy, with a sweet smile explained, "the Big Boat and I are yours, because you were so brave and kind."

"But the little old woman?" questioned the dear little, merry little sailor.

"Oh, it's such a long story," smiled the girl-fairy. "You ask the Magic Fairies, and come here and sit by my side and whistle your dear little, merry little tune!"

And so the next day the dear little, merry little sailor and the lovely little fairy-girl were married, and—lived happily ever after, of course!
—Helen Gregg Green.

The Growing Menace of Tax Exempt Securities

(Continued from Page 3)

still profitable for the million-dollar man to buy it. The result is, that the men with the large incomes obtain a much greater reduction in their taxes than the Government can hope to make up by a lower interest rate on the securities which it issues."

Tax-Free Bonds and Industry

The direct public loss which is brought about through inabality of the government to collect taxes on these bonds is only one of the arguments which may be brought against time. As stated above, the effect of the issuance of tax-exempt municipal bonds is also to encourage municipal extravagance and to hamper industry by diverting capital which under other circumstances would be invested in public utility, railroad and industrial enterprises.

Is there any need to point out that present conditions are driving liquid capital needed for production into unproductive channels? Men of large financial means now invest largely in municipal bonds, the income from which is totally tax-exempt. Mr. William Rockefeller, who died recently in New York, left $7,000,000 in Standard Oil securities which were taxable, but he also left to his estate $44,000,000 in municipal bonds, from which he had received an annual income of over $1,750,000, which was totally exempt.

Time was when farm mortgages were considered as gilt edge security, yet today they are almost a drug on the market. Both agriculture and industry suffer from the loss of the capital which has been withdrawn from constructive, productive business and hidden away in tax-exempt securities.

This thought was emphasized specifically by Richard T. Ely, Director of the Institute for Research in Land Economics and Public Utilities, when speaking this spring to the American Electric Railway Association he declared that electric railway securities must be relieved from the ruinous competition of tax-exempt capital so that they could be financed at more reasonable rates before they could get out of their present distressed condition.

The Situation in Michigan

Speaking of Michigan's taxation conditions, Mr. George Lord, member of the state board of tax commissioners, said recently:

"Personally, I believe we are almost at the breaking point now. There has never been a more universal cry against high taxes. It has never before been possible to interest people generally in taxation to the extent they are now interested. Farmers are deserting their farms in part because of high taxes.

"The fundamental evil is over-expansion of the public debt. Last year the state and national governments appropriated seven and a half billion dollars, the national share being approximately two fifths. Of that, 79 per cent was on general property.

"Much of that was spent in caring for interest and sinking fund payments on the public debt which has reached the enormous total of at least $33,000,000,000. Michigan's share alone is $400,000,000. That means interest charges of $20,000,000 to say nothing of payments to amortize the bonds. Authorities are too willing to borrow without heed to the consequences.

"Tax exemption speaks for itself. It is an evil too easily extended and results in completely unfair distribution of the burden of taxation."

Congress Shies at Shadow

Despite these manifold arguments against the tax-exempt feature of bonds issued by various governmental units, Congress has at its present session once more refused to put a ban on them. When this issue was being debated in Congress the opposition raised the objection that such action on the part of the federal government would impair the credit of the states or that if the credit were not actually impaired, the taxation of state and municipal securities would make it difficult to market them and so retard public improvements.

These objections should not worry us. Long before the day when high taxation gave tax-exempt securities the advantage they now enjoy, state and municipal bonds sold at a premium over the best public utility, railroad and industrial securities, and even if the effect of such legislation were to slow dow the rate at which our governmental units are rushing into debt, should that be regarded as an objection?

Legislature Must Act

In view of the present situation, the executive committee of the Michigan Real Estate Association recently adopted the following resolution:

"Failure of the House of Representatives of our Federal Congress to adopt a joint resolution proposing a constitutional amendment prohibiting the issuance of tax-exempt securities, is looked upon with profound regret by the Michigan Real Estate Association. Defeat of the resolution is a serious blow to real estate.

"So long as it is possible through investment of any kind, for vast sums of wealth to enjoy immunity from taxation, real estate as represented in farm, town home, business and industrial properties, must expect to bear a disproportionate burden of the cost of government.

"Sentiment in Michigan is preponderantly opposed to further issuance of tax-exempt securities. Some have believed, however, that Michigan should not tax her securities until similar action is taken by all states. Now Congress has failed to act. In the House debate it was declared that the question clearly was one for determination by the several states. Michigan's course is clear. The legislature of 1925 must act. By its action and by the action of other legislatures, Congressional disapproval of tax exemption will be hurried.

"The Michigan Real Estate Association, representative of property owners of Michigan, commends the action of those members of the Michigan delegation in Congress who voted for the passage of the joint resolution."

Laws removing the tax-exempt feature of both foreign and domestic bonds and making them subject to small annual specific taxes were passed at the recent session of the Legislature, but were vetoed by the Governor.

A Challenging Crisis

No doubt the general public agrees pretty thoroughly with the editorial comment of the Detroit Free Press that "when the House Representatives turned down the tax-exempt securities constitutional amendment, it went on record in favor of class privilege".

It was Abraham Lincoln, as we all remember, who made the epochal statement that this country could not exist half slave and half free. Were he living today he would no doubt say "This country cannot continue to exist half taxed and half tax-free".

It is evident that the time has come when we should have more people freed from the burden of oppressive and inequitable taxation and less tax-exempt securities—more tax-free people and less tax-free bonds.

SHOW BIG SAVING IN DITCH BLASTING

A DITCH blasting demonstration was recently staged by L. F. Livingston, head of the Michigan Agricultural College land clearing service, near Durand, Michigan, which developed some interesting data in the use of explosives for this kind of work.

"The ditch we worked on was an old one, filled in about two feet at the bottom," says Mr. Livingston. "Estimates secured by local authorities had placed the cost of clearing it at ten dollars a rod, while the best bid obtained was at twelve dollars a rod. Figures on the demonstration, which was entirely successful, showed that materials cost $2.36 a rod and labor fifty cents; a total of only $2.86 a rod for the work.

"We used three rows of holes, 18 inches apart with the rows 40 inches apart. One stick of 50 per cent straight nitro-glycerin dynamite, the only kind possible for this type of work, was placed in each hole. The blast cleared a good 12 foot strip in the bottom of the ditch."

The demonstration was made at the request of officials of the state department of agriculture.

DAIRY and LIVESTOCK

1925 HOLSTEIN CONVENTION AT GRAND RAPIDS

FRANK O. LOWDEN, Oregon, Illinois, was re-elected president of The Holstein-Friesian Association of America for the third time at the 39th annual convention of that organization's delegates at Richmond, Virginia, June 4th. Dr. L. M. Thompson, Montrose, Pennsylvania, was elected vice-president, and the following directors, whose terms expired, to succeed themselves: E. A. Stuart, Seattle, Washington; H. V. Noyes, Kenwood, New York; W. H. Mott, Harrington, Kansas; and R. E. Chapin, Batavia, New York. Next year's convention will be held at Grand Rapids, Michigan.

A three times-a-day milking test for the 305- and 365-day divisions of the advanced registry was adopted. To be eligible for this class, to be known as Class B, cows on long-time semi-official test are not to be milked more than four times daily the first 45 days and not to exceed three milkings a day the balance of the period.

The sentiment of the convention was in favor of adopting a plan for increasing consumption of Holstein milk and encouraging local breeders to market a higher class product.

To insure the attendance of the delegates at annual conventions, especially those from distant points a provision was made for reimbursement of railroad fare and traveling expenses to all delegates.

"SPEND A WEEK IN DAIRY LAND"

THE Publicity Committee of the National Dairy Exposition, after consulting with various Milwaukee and Wisconsin people interested in the success of the Exposition, has just announced the new slogan for the year—"Spend a Week in Dairyland." Exhibitors in the Exposition will feature this slogan in their advertisements in farm and dairy factory papers and will use it on letterheads and sales literature.

From all over the country information comes to the Exposition office regarding plans for trips and excursions to Milwaukee, which will not only include a visit to the Exposition but also a visit to Wisconsin's farms and factories, of which dairymen everywhere have heard so much. "Spend a Week in Dairyland" will appeal to every progressive dairyman who wants to visit the Exposition and at the same time see some of the famous farms and dairy plants of the great Wisconsin dairy territory. The slogan holds forth promise of a pleasant and profitable sight-seeing trip combined with real value from contact with the American dairy industry in all its many angles, as presented in the Annual Exposition.

ADVANTAGES OF SILAGE ARE SEVERAL

THE silo is not a new thing to Michigan dairymen because there are nearly 50,000 silos in use in the state at the present time. The very fact that there are this number in use proves their value in economic dairying and livestock farming. There are many dairymen and cow owners in the state who do not have silos at the present time. These men could produce meat or milk more economically if they had silage to feed.

Briefly the advantages of silage are as follows:

1. The silo saves feed. A large per cent of the food value of the crops ordinarily used for silage goes to waste on the farm. If this food is saved, production costs of livestock and livestock products can be reduced.

2. More cattle can be kept per acre where silage is utilized efficiently.

3. Silage furnishes a green juicy food for the cows in winter. This kind of food aids digestion and keeps the digestive tract in good condition.

4. Less labor is required and it is by far a more pleasant job to feed the crop through the silo than when the same crop is fed in cured form.

5. Silages saves on the hay bill. A ton of good silage is worth about one-third as much as a ton of mixed hay.—O. E. Reed, Professor of Dairy Husbandry, M. A. C.

VETERINARY DEPARTMENT

STALLION OUT OF CONDITION

I have a stallion that has been out of condition for four years. He has a pot-belly, rough coat, and if driven hard has colic spells, lays down and rolls. With these spells his manure gets very thin and watery. He is nine years old and very speedy. Two doctors have examined him, and they call it chronic indigestion. The last doctor gave him glaubers salts, 2 lbs. common salt, 1 lb. bicarbonate of soda ½ mixed together tablespoon full in food twice a day. This treatment does not seem to do much good. Last two springs he seemed to look good for a couple of months, then goes down in hard shape and gets lazy. If this horse was well I could sell him for at least $225. When he has the colic spells he bloats. Quite often he yawns, just like a person when they are sleepy.—R. G., White Cloud, Michigan.

I WOULD suggest that you try the following prescription: Fluid extract of nux vomica, two ounces; fluid extract of quassia, four ounces; fluid extract of gentian, two ounces; Fowler's solution of arsenite, twenty-four ounces; mix and give the horse two tablespoonfuls in a half cup of water mixed in his feed night and morning. If necessary this prescription can be refilled and given a second time.

The horse should in addition have good feed and care and a ration composed of one part bran, three parts oats with a little corn for variety, and good mixed clover and timothy hay would do very well.—John P. Hutton, Assoc. Prof. of Surgery and Medicine, M. A. C.

CALL A GOOD VETERINARIAN

I would like to ask through the columns of your paper a few questions regarding some cattle that have died recently belonging to a near neighbor of mine. He has lost six out of ten and one more is sick. They were all one year old this spring and in good condition, have been well fed and cared for. They do not live long after taken, from ten to twenty-four hours. When they are skinned there is red and dark spots on the flesh. We have searched every place where they have been, for poison but none has been found. Would the red and black and blue spots indicate poison or some disease? What would the cost be to have their stomachs analyzed by state authorities?—W. J. S., Grawn, Mich.

IT would be practically impossible, to make a diagnosis of the condition affecting the cattle in question basing judgement on the description given. The trouble might be due either to some intoxication or a contagious and infectious disease. A qualified veterinarian should be called in to make a thorough examination and if he is unable to arrive at a solution, specimens should be sent in to the laboratory of the State Department of Agriculture for examination. Such examination would be made without cost to the owner of the cattle.

It would be an enormous and expensive task to attempt the analysis of the stomach contents of any animal if no clue were available relative to the possible cause of the trouble.—B. J. Killham, State Veterinarian.

"Very Satisfactory Results!"
Gentlemen:—Kindly discontinue my advertisement after your next issue, both the chick and egg ad. I received very satisfactory results from your paper,—Yours truly Joseph Amster, Paw Paw, Mich.

Poultry Department

POULTRY VENTILATION IN SUMMER

THE importance of proper and thorough ventilation for poultry houses of all kinds during the summer months cannot well be overestimated. In the case of adult fowls it determines, to a large degree, their efficiency and productivity, because comfort is everything in hot weather and the hens that are kept comfortable are most likely to continue producing. Hens that are overheated at night, that are thrown into early molts, are certain to stop producing and their value ends there for the season—at least until they have recovered from the molt.

A similar condition obtains in the case of growing stock. Unless they are kept comfortable and have plenty of ventilation at night, they are certain to be continually going through partial molts, which constitute a severe drain on their constitutional vigor. It is natural for chicks to go through more or less of a continual partial molt during the growing period. These are called "partial chick molts" and several of them occur during the first five or six months of the chick's life. They are a severe enough drain upon the vitality of the chick without more of a molting burden being imposed upon the chicks through overcrowding, piling up and poor ventilation.

Be sure that there is plenty of air for the poultry of all ages. A hen is better off roosting in a tree or on a fence during the hot weather than she is in a hot, poorly-ventilated and arranged poultry house. But, at the same time, the best results are obtained where the shelter is right and available. Give the chicks colony roosting sheds, but be sure that they have protection from natural enemies and from the elements.

NEST CONSTRUCTION

THE would be poultryman has either one of two popular types of nests to choose from—wall nests and nests beneath the dropping-boards. Although the writer favors the type that are installed beneath the dropping-boards, wall nests may be made that reduce the bother by the fowls to a minimum, such as taking the litter from the nests, roosting on the edges, etc.

Wall Nests

In order to be satisfactory, these nests will have to extend about 20 inches from the wall of your poultry house, the wall serving as the back part of your nests. A shingle binder or some such support is nailed to the posts, about 18 or 20 inches from the floor and supported to the floor making a steady frame.

The floor boards for the nests are fitted on, and cleated; if you wish your nests to be removable to facilitate cleaning, don't nail these floor boards to the supports. Now nail a seven or eight-inch board to the front of your nest floor; fit the end pieces on, allowing plenty of slant so that the cover may be fitted on so as to keep the fowls from roosting thereon. When making these end pieces, allow space for a small door at the lower corner near the wall, of sufficient width and height to enable a fowl to pass through.

A Hinged Cover

The partitions between the nests are put in next, allowing 12 to 15 inches width to a nest. These partitions may be as high as your front piece, and nailed to it. They should be long enough to allow the fowls a passage between their rear ends and the wall. A four-inch board is nailed to the rear ends of the partitions, to keep the nesting material where it belongs.

The cover should be put on now, covered with tarred paper, and a part of it fitted and hinged so that it may be lifted up, and the eggs gathered.

A walk-way or a small shelf, may be placed at the entrance of the small doors, so the fowls may find ready access to the nests. These nests are thus quite dark, helping to prevent egg-eating, and are used by people who do not care to have nests beneath the dropping-boards on account of the necessity of having these drop-boards 30 inches or more from the floor when nests are to be placed under them.

Drop-Board Nests

These should be fourteen or fifteen inches from top, (or under-side of the drop-boards) the floor of the nests, and your end supports want to be nailed to your end posts accordingly. In case a middle support is needed, you can put one underneath the nest-floor after latter is in place. Don't nail it from a post, as this would give the fowls a chance to roost on this exposed edge of the support. (From the rear of the nests back to the wall.)

The nest-floor is 15 to 18 inches wide; saw your boards to sufficient length, allowing for any end posts. To the outer edge of what is your rear board nail a three or four-inch board, to keep the nesting material in. No pole or shelf is necessary for the fowls to hop up on to see their way into the nests. Such is a nuisance. Lay the nest floor carefully, and cleat together. On the front edge of the front board, nail a four or five-inch piece, same as on rear edge.

Easily Kept Clean

Allow the front part of your nests, which are to be hinged doors, to go about one, one-half or two inches back from the front edge of your dropping-boards, thus saving this front from a possible defacing by fowls standing on the drop-boards. You should allow for this when building your drop-board frame, by letting the front edges of your drop-boards project two inches or so over the front support.

The doors are made and hinged with metal hinges to the four or five-inch piece you put on the front board. Fasten by means of buttons so fixed that each door will be held firmly. One button to a door is sufficient. Doors should be from four to six feet long, or shorter or longer, if you can handle them properly. A small spool or gate hook eye fastened near the top and central part of each door, enables one to lower and raise the doors conveniently.

This type of nest gives me good service. Use hay for nesting material, sprinkle frequently with louse powder, and renew once in a while. Paint or whitewash will also help your nests to make a good appearance to yourself and others.—Maine Farmer.

PICKING GEESE

At what time of the year do we pick live ducks? Are we allowed by law to pick live ducks?—Mrs. A. C. W., Beulah, Mich.

THIS practice is limited almost entirely to goose raising because the goose feathers are much softer than either the duck or poultry feathers. Many geese raisers make a practice of picking their stock twice a year. The young geese can be plucked soon after they become fully feathered. At this time the feathers are ripe and pull very easily. There is, however, a greater danger of tearing the skin of the young stock, than there is in picking the old birds.

Geese should not be plucked during the laying and breeding season, nor during extremely warm weather, unless they have an excellent pasture, with plenty of water and shade. Ordinarily, a new crop of feathers will be completely grown in by six weeks.—E. C. Foreman, Professor of Poultry Husbandry, M. A. C.

AN ERROR

The word "editorial" in the second paragraph of the article on page 3 of our May 24th issue was erroneous. It should have been "letter".

Makes Him Homesick

'Shut the door," yelled the rough man. 'Where were you raised—in a barn?'

The man addressed complied, but the speaker, looking at him a moment later observed that he was in tears. Going over to the victim he apologized.

'Oh, come," he said soothingly, "you shouldn't take it to heart because I asked if you were raised in a barn."

'That's it, that's it,' 'sobbed the other man. "I was raised in a barn and it makes me homesick every time I hear an ass bray."—Los Angeles Times.

SUMMER POULTRY TROUBLES

As warm weather approaches, new troubles come to the poultryman, whether it be on the farm or in a regularly established poultry plant. Mites, lice and other insects will breed more rapidly in summer than in winter, and infested pullets are poor layers. During the winter and spring months, many poultry keepers, with poor equipment, have been troubled more or less with disease, the result of colds contracted through poor ventilation, drafty houses, and unclean and unsanitary conditions. These same poultrymen will have trouble with insects, for an unclean house, unclean nests and dirty runs will breed more insects that prey on chickens than can be killed with all the dip that can be used.

Poultry houses should be thoroughly cleaned at least twice a week. Oftener would be better. Every crevice and every roost should be sprayed with some insecticide, and if the birds are confined to small yards, the posts should be sprayed, because all of these places harbor insects which prey upon the chickens.

Nest boxes should be emptied and cleaned and new straw put in as often as once a week. No opportunity should be given mites to multiply, or lice to find refuge on the chickens. A pullet which spends most of its time picking itself has little opportunity to scratch in the soil for bugs and worms, or to feed from the mash hopper. An improperly fed chicken is a poor layer. There is no profit in poultry, no matter how well bred, unless they are given the proper care.

MARKETING SUMMER EGGS

Mid-SUMMER egg prices compare favorably with prices in mid-winter. There is only one period in each year when fresh eggs are almost a drug on the market, and that is during the months of March and April. By the first of May, poultry in the Southwest begins to decrease in production, and during June, July, August, and September, consumers are always willing to pay a premium for eggs that they know are strictly fresh and but a day or two old.

Eggs, in hot weather, must be marketed more often than in winter. During the cold months, it is possible to keep them over a period of a week or two and to market in larger quantities, but not so in July and August. Even infertile eggs will become tainted and strong if kept more than a few days.

The consumption of eggs in the summer months would be greatly increased if consumers could be assured of their freshness. One strong or tainted egg served at breakfast often decreases the consumption of eggs many dozen during the weeks that follow. Swearing off on eggs in summer time results from the serving of eggs not strictly fresh. It destroys the appetite for the product of the poultry farm. Therefore, the poultryman, or the farmer who markets his eggs as soon as collected, soon earns a reputation for quality goods and he will find that the demand at fancy prices will exceed his supply.

Eggs should be infertile, gathered daily and marketed at once. It is the only way to make money on poultry in summer time.

FUR FARMS

In some places, foxes may be pests, but Canada tells a different story. There the fox is a source of large profit; and he is not the only fur-bearing animal which if not actually domesticated, is at least kept within range so his fur may be available when wanted.

With most of the fur-bearing animals of the colder climates, we are little concerned. They will not thrive in our latitude. But with foxes it is different. Even the most valuable of these, the silver fox, can be acclimated, and in fact has been acclimated.

There are fur-farms scattered along the slopes of the Applachians; and pelts from those farms supply a constantly increasing, though yet small, proportion of the annual market. A good pair of silver foxes cost more than blooded cattle except the very highest prize winners, but the progeny of these bring prices unapproachable by undemonstrated calves.

For breeding purposes, pairs of silver foxes are reckoned in terms of thousands of dollars; for pelts multiples of hundreds make the standard of value; but good pelts bring several hundreds. The business is rather expensive to start but is not costly to maintain, and the yields, with proper management, are astoundingly satisfactory.

Fur farms have passed beyond the experimental stage. They are no longer a simple gamble. The experience of hundreds is to had for the asking; and with few exceptions this experience is encouraging. All fur farms have not been successful, but the history of other farm enterprises is no more satisfying. Luck plays its part in agriculture, despite all reasonable precautions; but intelligence counts for far more; and the intelligent fur farmer has been making good.—Southern Planter.

Oh, Money! Money!

(Continued from page 10.)

—" Even under his breath he did not finish his sentence; but, with a new, quite different expression on his face, he resumed his nervous pacing of the room, throwing now and then a quick glance at Miss Maggie's still averted face.

"It was absurd, of course, wasn't it?" Miss Maggie stirred and spoke lightly, with the obvious intention of putting matters back into usual conditions again. "But, come, tell me, just what did you do, and how? I'm so interested—indeed, I' am!"

"Eh? What?" Mr. Smith spoke as if he was thinking of something else entirely. "Oh—that." Mr. Smith sat down, but he did not go on speaking at once. His eyes frowningly regarded the stove.

"You said—you kept Pennock and Gaylord away," Miss Maggie hopefully reminded him.

"Er—yes. Oh, I—it was really very simple—I just monopolized Mellicent myself, when I couldn't let Donald have her. That's all. I saw very soon that she couldn't cope with her mother alone. And Gaylord—well, I've no use for that young gentleman."

"But you like—Donald?"

"Very much. I've been looking him up for some time. He's all right."

"I'm glad."

"Yes." Mr. Smith spoke abstractedly, without enthusiasm. Plainly Mr. Smith was still thinking of something else.

Miss Maggie asked other questions—Miss Magie was manifestly interested—and Mr. Smith answered them, but still without enthusiasm. Very soon he said good-night and went to his own room.

For some days after this, Mr. Smith did not appear at all like himself. He seemed abstracted and puzzled. Miss Maggie, who still felt self-conscious and embarrassed over her misconception of his attentions to Mellicent, was more talkative than usual in her nervous attempt to appear perfectly natural. The fact that she often found his eyes fixed thoughtfully upon her, and felt them following her as she moved about the room, did not tend to make her more at ease. At such times she talked faster than ever—usually, if possible, about some member of the Blaisdell family; Miss Maggie had learned that Mr. Smith was always interested in any bit of news about the Blaisdells.

It was on such an occasion that she told him about Miss Flora and the new house.

"I don't know, really, what I am going to do with her," she said. "I wonder if perhaps you could help me."

"Help you?—about Miss Flora?"

"Yes. Can you think of any way to make her contented?"

"Contented! Why, I thought—Don't tell me she isn't happy!" There was a curious note of almost despair in Mr. Smith's voice. "Hasn't she a new house, and everything nice to go with it?"

Miss Maggie laughed. Then she sighed.

"Oh, yes—and that's what's the trouble. They're too nice. She feels smothered and oppressed—as if she was visiting somewhere, and not at home. She's actually afraid of her maid. You see, Miss Flora has always lived simply. She isn't used to maids—and the maid knows it, which, if you ever employed maids, you would know is a terribly state of affairs.

"Oh, but she—she'll get used to that, in time."

"Perhaps," conceded Miss Maggie, "but I doubt it. Some women would, but not Miss Flora. She is too inherently simple in her tastes. 'Why it's as bad as always living in a hotel!' she wailed to me last night. 'You know on my trip I was so afraid always I'd do something that wasn't quite right, before those awful waiters in the dining-rooms, and I was anticipating so much getting home where I could act natural—and here I've got one in my own house!' "

Mr. Smith frowned, but he laughed, too. "Poor Miss Flora! But why doesn't she dismiss the lady?"

(Continued in July 5th Issue.)

Much Longer

Willie: pa?
Father: Yes, Willie,
Willie: Pa, how is it that my hair has grown longer than yours when yours has grown longer than mine?

Starting Into the Poultry Business

THE writer has a funny question before him. A party writes that he is going to the wall in the chicken business. He further states that he always had a desire to go into the chicken business and attempted it three years ago, but finds no profit in the business, altho, he knows of several people who have made lots of money in the business. He says among other things; he put in $1,000 for equipment and paid out another thousand or more for expenses. Out of 26,500 eggs he hatched 10,000 chicks and raised only a little over 1,000 of them. He says he calls this a failure and I believe I will call it the same. This is not the only one that has done practically the same thing. These same people would just as surely fail in the banking business or merchandising as in the chicken business. How many like this man, start at the top round and invariably come down to the bottom round and make a "howl that it's a failure."

Remember the chicken business requires but little capital. While the chicken business requires but little capital, it does require some good common sense. The writer had but little of either, but just enough of the latter to tide him over for a few years until he got a little experience and that experience is worth more than all the money you could put into the business in the start. There seems to be a general idea that just any "old sket" can buy an incubator and raise chickens. This is a mistaken idea, indeed. It takes skillful knowledge to make a success with fowls. You must not get the idea that you can make a fortune out of the business in one year, as that is one erroneous idea that is greatly magnified. The facts are just this, you have got to start in poultry in a small way. There is nothing that goes to the bad as quickly as a flock of fowls. You have got to grow in the business as your experience grows, every other business is that way and so is this.

A friend of mine, started in the business about the same time we did. He used large half-page space in all the leading journals to advertise his products, when he really had nothing to sell. He built magnificent buildings and bought equipment of every kind, in fact he was the talk of the entire community. He would come to our place and wonder how I got along with so few equipments. He had the nerve to throw fun right in my face. People told me that it was only a question of time, when I would be down and out. But, sorry to say, it was but a short time, until he was compelled to make an assignment to pay his advertising and building bills. While I have never made any great success, yet I have kept right on "sawing wood" and today I find our friend in the city working by the day. It's all right to advertise, but it must be done in a rather judicious way.

In the first place you must have good stuff. If you are in the fancy breeds, you have simply got to have the goods that stands out as the very best of it's kind. If you are in the market egg business, you must offer only the very choicest fresh eggs you can produce and don't offer any other. It's useless to breed a fine lot of good thorough-bred fowls and never let the public know what you have. Use good farm papers to advertise your products, be honest, give your customers a square deal in every instance. Pay your advertising bills when they become due, don't reach out further than your ability to master. Keep close to the shore, as the saying goes and handle the poultry business along conservative business lines and you are sure to make a success.

The farmer he is more fitted to make a success than any other class of people living to my knowledge. He grows his own feed, he has plenty of range, he knows how to begin in a small way and able to increase his flock as his business grows. There is only one excuse for any one making a failure in the poultry business and that is bad management. There will be plenty of people that will buy your fowls if you have the quality and they the convinced that you have. Just today, a party drove to our farm for several miles to buy some fowls, that he saw we had advertised, but we could not supply him because we were sold out of the particular kind he wanted, so he engaged eggs to be delivered next spring. You cannot keep pace with the demand if you have the quality and principle to deal honorable with your customers. Life is too short to sell your soul for a dollar anyway.—J. C.

Dairymen's League Has Milk Plant on Wheels

HARRY A. SIECK, chief engineer of the Dairymen's League Co-operative Association, Inc., of New York, has put the finishing touches to a brand new kind of a milk plant that is unique in the history of the milk industry. Mr. Sieck's latest contribution to scientific milk handling is an emergency milk receiving station on wheels that can be taken by rail at a moment's notice to any part of League territory.

The plant is contained in two standard refrigeration cars, each 40 feet long. One is a power house; the other the milk handling station. When the call for service comes the plant can be transported to the point where it is needed. The emergency plant can be delivered to the most distant place in League territory in a very short time.

In case a League plant is destroyed by fire, or a break down unexpectedly occurs that puts an operation out of commission, or the necessity arises for a sudden diversion of milk in some particular locality, the portable receiving station will be drawn by a railroad locomotive to the place where the emergency exists and the handling of milk will go on as if nothing happened.

The plant is in itself a complete receiving station with a capacity of 250 cans, or 10,000 quarts a day.

The power car has facilities for producing its own refrigeration by means of a 12 ton ammonia plant. It has a 10-Hp. high pressure boiler for heating water and generating steam required for washing and sterilizing cans. It contains a 3½ kilowatt, 110 volt, direct current, light and power system. The plant has an electric driven compressed air unit for the agitation of milk and for supplying water tanks with pressure.

The power car carries a reasonable amount of fuel oil for the operation of the various power units. Besides it has a full complement of supplies, tools, piping, etc., together with a conveyor system for adopting each operation in its particular location. It also contains space for storing about 75 cans.

One of the most vital features of any milk operation is its water supply and sewerage system. The Sieck plant is so designed that it can hook up with a water or sewerage system, or both, within 500 feet of its location. Thus, it a plant burns down or one suddenly goes out of commission, the portable receiving station can be transported to the site and connections made with the existing water or sewage system.

A farmer delivers his milk at the door in the middle of the second car. The milk is dumped into the weighing can and weighed. Then the farmer's cans are passed to the washer at the back end of the car where they are washed, sterilized and dried almost before he can drive his rig away from the door. The milk passes from the weighing can to the receiving vat which has a capacity of 200 gallons. It is then pumped through an internal tube cooler where it is cooled while en-route to a glass lined tank with a 600-gallon capacity. From the tank the milk is run off into 40-quart cans in which it is transported to the city markets.

Good Qualifications

"What profession is your boy Josh going to select?"

"I'm going to educate him to be a lawyer," replied Farmer Corntossel. "He's naturally argumentative an' bent on mixin' into other people's troubles an' he might just as well get paid fur his time."

CHICKS of QUALITY
Bred from Sires of 250 to 280 EGG STRAINS

BIG BARGAINS for June and July

Prices now within the reach of everybody. Get chicks in June and July and gather your harvest next winter. This is the most economical time to buy and the most favorable time to raise chicks. You can get them in the big outdoors at once which saves labor, cuts down your feed bill and makes the chicks grow twice as fast. Bright, balmy days bring splendid development. Our June chicks will begin to lay in October and July chicks in November. The BIG SAVING in price gives you an opportunity that you cannot afford to let pass by.

Chicks that are strong, peppy, from high production, egg bred stock are the chicks that pay. We have sacrificed on price but the same standard of supreme quality is always maintained regardless of price. Our breeders are producing heavily, our incubators working to full capacity and this enables us to give these high grade chicks at such extremely low prices.

MARKET FLASHES

MARKET SUMMARY

All grains steady after recent advances. Beans firm. Potatoes mostly steady. Receipts of poultry have been large and demand not enough to handle receipts. Butter and eggs find ready market at firm prices. Dressed calves steady. Cattle and sheep from steady to lower.

(Note: The above summarized information was received AFTER the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press.—Editor.)

FOOTE'S MARKET LETTER

BY W. W. FOOTE

Brightening Farmer's Outlook

IT is cheering to observe the better outlook for farmers and to note the expectation, based upon reduced world wheat crops, of higher prices, the rise having started. Farmers as a class are getting out of debt, and they are borrowing less money, although rates of interest in farming districts generally are not unreasonably high. Probably the most unsatisfactory thing just now is the late season for corn planting, and unless conditions change for the better at once, higher prices may be expected. Kansas temperatures have been reported as the lowest in twenty years, and Iowa, the largest corn raising section in the world, has had the lowest temperature in twenty-four years. Michigan farmers are greatly encouraged over the good prices paid for their lambs, and in various districts there is a marked increase in the sheep breeding industry. Cutover lands in central Wisconsin are being devoted to raising flocks of high-bred sheep, and in the north central part of that state, about 75 miles south of Lake Superior, a farm of 480 acres is being developed by reclaiming the land from stumps and bribush by using 400 Montana ewes.

Smaller Wheat Crop

The June crop report sent out by the United States Department of Agriculture indicates a winter wheat crop of 509,000,000 bushels, or 63,000,000 bushels less than was harvested last year and 116,000,000 bushels below the last five year's average. The spring wheat crop is estimated at 184,000,000 bushels, or 29,000,000 bushels less than was raised in 1923, showing a reduction of 92,000,000 bushels from the last five year's average. The total wheat crop is placed at 693,000,000 bushels, or 93,000,000 bushels less than that of 1923, comparing with a five-year's average of 881,000,000 bushels; and it is the smallest crop, both in acreage and yield, since 1917. The oats crop is estimated at 1,232,000,000 bushels, or 68,000,000 bushels less than that of 1923. The rye crop is estimated at 62,500,000 bushels, or 1,000,000 below that of last year; while the barley crop is estimated at 160,000,000 bushels, or 38,000,000 bushels less than last year's.

The Advance in Wheat

Michigan wheat farmers were taken by surprise when prices for wheat shot up several cents a bushel on the bullish sentiment caused by the crop report for June. After selling around $1.04 for some time in the Chicago market, prices rose to $1.12¼, and this was a fraction higher than was paid a year ago, but looking back two years, it is seen that at that time as high as $1.25 was paid. However, it is encouraging to see that a change has come, and it is hoped that the crop will be marketed at prices yielding a fair profit for farmers. It is estimated that the countries, exclusive of the United States, which have reported their wheat acreage so far will raise 115,000,000 less than last year. New hard winter wheat has been purchased to export, but this business is small in volume, the season being nearly two weeks later than usual. New wheat is about ready to cut in Oklahoma, but harvesting is not expected to begin in Kansas before July. The railroads are going to do their part in moving the crop, and 20,000 cars are being stored for this purpose west of the Missouri River. The flour trade has started up at last, and millers' purchases have been the largest seen for months.

Higher Wheat Coming

"The wheat situation is different from anything that has ever existed," says George E. Marcy, president of the Armour Grain company, who has been a strong believer in better prices for wheat and rye for several weeks. "The government report indicates not to exceed 100,000,000 bu. available for export the coming year."

The Pacific coast is bound to sell more or less flour to the orient, and mills there will not only cause a shortage on the Pacific coast, but will also reach far into Montana, Colorado, Kansas, and Nebraska for wheat. Texas and southern Oklahoma wheat will move to the gulf and be sold for export, probably 30,000,000 to 40,000,000 bu. going. Then Virginia, Maryland, Pennsylvania, and other eastern states will move more or less wheat to the Atlantic seaboard for export.

"Then comes the durum wheat which Europe must have, besides the low grade flours which are always sold abroad. Just the ordinary situation, which even low prices in other countries will not affect, will clean the United States of all its surplus wheat promptly. On top of this, probably the American cooperative wheat pools were never so strong as they are today, and all of their influence will be exerted to hold their wheat for good prices, which can easily be obtained, provided those farm outfits work togather.

"The 42c duty protecting it means the farmer will be able to put wheat and rye prices very high.

"This whole bread food situation will be reflected no doubt the world over, as shortages in the wheat crop in pretty near all the northern hemisphere are now apparent. Wheat and rye are the cheapest foods obtainable. Apparently the world for the year ending July 1 will not have a carry-over out of the 3,300,000,000 bu. crop of over 250,000,000 bu. With the cut in the United States wheat crop of 100,000,000, the probability of a cut of over that amount in Canada, to say nothing of decreases in other parts of the world, it makes a wheat and rye situation such as we have not seen in many years. Apparently the United States wheat farmer will come into his own, provided he is fortunate enough to secure the present crop prospects."

Late Season For Corn

The season is unusually late for corn, cold and wet weather having delayed planting, while much grain has rotted in the ground, rendering replanting necessary. Late corn sales were made at nearly the same prices as a year ago. July delivery selling on the Chicago Board of Trade around 81 cents, but a little more than two years ago sales were made below 61 cents. If a fair crop is raised this year, plenty of hot forcing weather, as well as plenty of rain, will be necessary. July oats have sold recently around 47 cents, comparing with 41½ cents a year ago, while two years ago it sold down to 37 cents. Low rye prices have started up an export demand for rye, recent sales having been made around 75 cents, comparing with 70½ cents a year ago.

Chicago's Cattle Market

It is a great relief to the market when country shippers fail to over supply the wants of buyers at the opening of the week, and with a run of 18,432 head on Monday last week, prices shot up promptly from 15 to 25 cents, the general local and eastern shipping demand being animated. On the following day the advance largely disappeared on medium to good lots, but the few prime heavy steers sold a little higher, while a sale was made of a string of 56 Nebraska fed yearlings averaging 940 pounds at $11, or 50 cents below the price paid for the best heavies. Later excessive supplies put prices for most kinds lower, with the bulk of the recent sales of beef steers at $8.25 to $11. The best heavy steers sold at $10.50 to $11.50, with fairly good light weight steers selling as low as $9 and sales all the way down to $6.75 to $7.75 for the commoner lots, while inferior little steers went at $4.50 to $6.65. The best yearlings sold at $10 to $11. Butcher stock was mostly 50 cents lower, along with steers, sales of cows and heifers being made at $3.85 to $9.85, while canner and cutter cows sold at $2 to $3.75, bulls at $3.50 to $7.75 and calves at $5 to $11. After a period of slow and declining markets, the reduced offerings of stockers and feeders have resulted in an average advance of 25 cents, most sales being made at $6 to $8.50, inferior lots going as low as $4.75 and the better lots at $8.60 to $9.10. A year ago beef steers of common to prime grades sold at $6.75 to $11.20 and two years ago at $7.75 to $9.75. Combined receipts in twenty markets for the year to late date amount to 5,563,000 cattle, comparing with 5,572,000 a year ago.

Chicago's Hog Market

Excessive receipts have been the cause of the many declines in prices of late, and had supplies been normal, much higher markets would have been witnessed, for the local and shipping demands have averaged extremely well, with particularly large purchases of prime finished swine weighing from 130 to 300 pounds. Recent receipts averaged 237 pounds, being four pounds less than a year ago, but four pounds above the ten year average for corresponding weeks. Of late the bulk of the hog sales have taken place within a range of about 45 cents, with prime heavy butchers at the top, these selling 25 cents higher than the best light bacon weights. Underweights are much too numerous and sell at a large discount. There is a large domestic consumption of fresh and cured hog products, but the exports of lard and cured hog meats are still running far below a year ago. Recent hog sales were made at sharp declines in prices, with excessive receipts. Combined receipts in twenty markets for the year to late date amounted to 20,690,000 hogs, comparing with 20,058,000 a year ago and 15,440,000 two years ago. A year ago hogs were selling at $5.80 to $7.05. Late sales were made in Chicago at $6.15 to $7.40, showing a moderate decline for the week.

Marketing Spring Lambs

Native spring lambs, as well as springers from Idaho and other states, are being marketed steadily, and many have arrived in the Chicago market. Not many feeder lambs are offered, but a few days ago a sale was made of 587 head of Idaho 57-pounds feeders at $13.50 per 100 pounds. Late sales were made of spring lambs at $10.50 to $16.25 for natives and $16.50 to $17.10 for Idahoes. Breeding ewes are in demand at $6 to $11.50. Feeder lambs sell at $11 to $13.25. The Department of Agriculture reports the number of lambs in the areas that furnish the bulk of the market supplies during July and August is larger than last year, but the movement from Kentucky and Tennessee is nearly a month late.

WHEAT

Trading was quite active in the wheat market last week and prices advanced several times. There is a feeling that wheat is going to be scarce this year and the bulls are running the market at present. Millers are buying right along these days and selling their flour at increased prices, Foreigners bought considerable grain the forepart of last week and then retired from the market. However, they are expected to come back this week.

CORN

Corn prices are higher than they were two weeks ago while receipts show no increase. Believers in a hot summer this year are expecting prices to seek much higher levels before another crop is harvested. There are plenty of buyers in the market at present but it is hard to find anyone who wants to sell a very large quantity. The market is firm at this time.

OATS

Following the trend of other grains oats advanced in price during the two weeks ending Saturday. Demand is good with receipts of fair volume. Country offerings to arrive were light and the market is firm.

RYE

Rye is wanted at higher prices, the market advancing at Detroit 4 cents in the fortnight ending last Saturday; and 3 cents of the 4 cents advance was made during the latter half of the fortnight.

BEANS

Dealers who have sold themselves short of beans are not feeling very well these days while the bulls are having things pretty well their own way. Prices at Detroit advanced 20 cents during the two weeks ending June 14 and the market is firm. The increase in price fail to bring out many beans as there is a feeling that the price should be up around $5 per hundred pounds. Another article on beans appears in this issue on page 4. Do not fail to read it.

POTATOES

Trading in potatoes is rather light and prices somewhat lower. In spite of these facts the market is about steady at most points. Old potatoes at Detroit are considerably lower in price.

MARKET QUOTATIONS

Wheat

PRITCHARD'S WEATHER FORECAST
INTERPRETED BY THE STARS

Week of June 22

UNSETTLED and showery weather conditions are expected in Michigan during the opening days of this week during which time temperatures will be cool but not uncomfortably so for the season of the year.

During Monday or Tuesday the sky will clear and there will be a brief period of warm sunshiny days and clear nights. Before the end of the week temperatures will be up around the 80 degree mark.

During the latter part of the week there will be electrical and hail storms and tornadoes in local centers. The general characteristics will be heavy local rains and showers and some very high winds.

Immediately following this storm activity will come a cool spell during which time temperatures will fall to a point between 55 and 60 degrees.

Week of June 29

Fair to threatening weather will effect most parts of Michigan during first few days of this week. During Monday and Tuesday showers and high winds will visit many sections of the state.

Cool and generally fair weather will effect Michigan during the middle part of the week. About Thursday or Friday temperatures will be on a rapid increase in this State and will continue into next week.

We are not expecting any general severe storms in the state during the last part of this week but locally there may be some heavy showers.

Farm Prices Sluggish

Farm conditions over eastern half of Uniter States will be far from good although there is no question but that they could be much worse. The farmer during the summer months will not realize his hopes of a full crop or high prices.

FARM MECHANICS

TRACTOR VALVES IN AUTOMOBILE ENGINES

Will you please send me full instructions for installing Fordson tractor valves in a Ford automobile engine? Is it true that with Fordson valves you can get more power out of a Ford automobile engine?—D. P., Michigan.

WHILE we do not have test figures showing the effect of installing Fordson valves in the Ford model T engine it seems reasonably certain that larger valves will permit more power to be developed under certain conditions.

So far as pulling capacity, such as the ability to get out of a mud hole or climb a hill, is concerned there will be no difference. If a Ford engine will make a certain pull at all it will do so as well with the regular valves as with any other, the only difference being that larger valves may permit the pull to be made at a faster speed. In other words, valve capacity is not a limiting factor at low or medium speed, but becomes a limiting factor at high engine speed.

It should be understood also that the valve size is important only as it influences friction or resistance of the mixture going into the cylinders, and that friction in the carburetor, intake manifold, and ports, and also the exhaust manifold, pipe and muffler is just as important as in the valves themselves. Nevertheless we are inclined to think that a small increase of power at high speed and a great maximum speed could be obtained by the use of Fordson valves without much other change.

Fordson valves have the same diameter of stem as the Ford valves, but the stem, is longer and the head is larger in diameter. So far as the stem is concerned it is only a matter of cutting it to the right length and drilling a hole for the pin which holds the valve spring washer. The head of the Fordson valve is about 3/16 inch larger in diameter than the regular Ford valve. This means that the valve seat should be reamed out about that much larger. Also, the hole beneath the seat should be reamed or bored out about 3/16 inch larger in diameter so as to give the same width of seating contract as before. Usually there is plenty of iron to make this much enlargement without getting into trouble. If it is attempted to enlarge the side of the opening of the port by the same amount there may or may not be trouble, depending on whether the cores may have shifted in making the casting and left the iron too thin at some points. If the boring tool breaks through the water jacket it means that the hole must be welded, and in doing so the block is likely to be warped sufficiently to require regrinding of the cylinders and fitting of new pistons and rings. Consequently we would not advise reaming out the side openings of the ports unless you are going to put on a larger carburetor and intake manifold and in general spend considerable money on the job.

In boring out the top of the port the boring tool should have a pilot or stem fitting accurately in the valve stem guide so as to center the cut accurately, as it is important to have the width of contact between valve and seat uniform all the way round.

SAY HYDRATED LIME CLAIMS OVERSTATED

CLAIMS being made in the state at present that a few hundred pounds of hydrated lime are as good as a ton or more of limestone for agricultural purposes are not born out by experimental work at various Michigan Agricultural College test stations.

"Such statements are erroneous," says Dr. M. M. McCool, head of the college soils department, "and doubtless lead to a high per acre lime cost in certain sections of the state."

Results of experiments on the relative efficiency of hydrated lime, finely ground limestone, carried on by the college at the Cass County farm and other experimental plots, have thrown interesting light on this important question. The conclusions are supported, also, by work in other states.

"As a result of these and many other experiments," says Dr. McCool, "we have steadfastly maintained that under most conditions it is doubtless more practical for a farmer to use limestone, preferably the finer material, such as the finely pulverized stone or the medium finely ground limestone, than it is for him to use the hydrated lime.

"We have adopted the following figures for a working basis: 500 pounds of hydrated lime, 800 pounds of finely pulverized lime, or 1000 pounds of medium finely ground material should be considered to the same results the first year of application, provided they are well incorporated with the soil and there is a sufficient amount of rainfall."

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

PONTIAC STRAIN

Our Pride Mark Protects You

Where Dollars Grow---

UNDER OAK TREES!

$30,000 Per Acre is a Very Profitable Crop

Over $300,000 of new wealth has just been created, on our main ranch at the corner of the Rochester and Dodge Roads, in a fenced-in area of about ten acres

Our Main Ranch, which has been closed to visitors since the new year—for the breeding season—is now open for inspection by those interested—by appointment only.

Passes will be mailed on request.

Yes—virtually one-third of a million dollars—which will be distributed among the fortunate owners of Pontiac Strain Silver Black Foxes.

Many litters of five—six and seven—were born—giving to the owners of these Foxes—as high as three thousand dollars cash profit from just one Pair!

The Demand for Pontiac Strain Foxes—Created under the Pontiac Plan—has made it imperative to increase our producing facilities to the extent that under present plans for expansion approximately 500 pens will be added—this year—for Pontiac Strain production.

The Pontiac Plan—provides for an extensive advertising campaign to put—Pontiac Strain Silver Fox Furs—on a direct from Ranch to Wearer—Basis.

This campaign—in High Class Women's Magazines—will create a demand for Pontiac Strain Furs—from which every owner of Pontiac Strain Foxes—will collect large profits.

To the end that the very choicest of Pelts may be offered—virtually all of the highest class breeding Stock available—is being brought under the control of the Pontiac Strain organization.

With the resources and organization at our command—Pontiac Strain and the Pontiac Plan—is becoming a dominent factor in the Silver Fox Industry!

To win success associate yourself with the successful.

Fordson

Ample Power for Quick Economical Threshing

Fordson Power is never more appreciated than at harvest time when threshing must be handled on the most economical basis to insure satisfactory profits.

On thousands of farms this year Fordson Tractors will furnish the power for quick, thorough and economical threshing. Fewer men with Fordson Power will thresh more grain at a lower cost. Bigger grain profits will result.

And with the threshing done Fordson Power is ready to bale hay, grind feed, fill the silo, saw wood, handle your fall plowing, etc., all at a big saving in time and money. On farm jobs of every description and for all belt work, Fordson Power proves the most profitable farm investment you can make.

Now—before harvest—is the time to buy your Fordson. See your nearest authorized Ford dealer today.

Could Our Tax Totals Be Held Down By Law?

Michigan Real Estate Association Advocates Fixing by Law Absolute Maximum Amount of Money to be Raised by Taxation During Given Period

By STANLEY M. POWELL

(Lansing Correspondent of The Business Farmer.)

IT has been our purpose in preparing this series of taxation articles not merely to call attention to taxation conditions already too well realized through very bitter experience, but to point out as accurately as possible the conditions as they exist and then to discuss some of the proposed remedies frankly and fairly and from an unprejudiced view-point.

We loathe and despise the cheap and shallow clap-trap of political demagogues, but we feel keenly that there is a tremendous need for more education and popular understanding on this great matter of an equitable distribution of the ever-increasing cost of governmental support.

The subject of taxation is altogether too broad, too deep, too comprehensive, too far-reaching in its effects and ramifications to be treated adequately in any one article—or even in any few articles. From the standpoint of citizen ship and self-government there is no more pressing problem confronting the American public today. This truth was recently uttered with remarkable emphasis by our President. His statement comes to us with unusual force and significance.

Taxes and Freedom

"Taxes," said Calvin Coolidge, "are fundamental. They mean more than money. A dollar belongs primarialy to the man who earns it. We work for the government to the extent of the taxes we pay and to that extent do we give up our freedom. The history of the struggle for freedom is largely a history of a struggle against taxation."

Again in a public speech, the President declared, "As the standard of civilization rises, there is necessity for a larger and larger outlay to maintain the cost of existence. As the activities of government increase, as it extends its field of operation, the initial tax which it required becomes manifolded many times when it is finally applied by the ultimate consumer. When there is added to this aggravated financial condition an increasing amount of regulation and police control, the burden of it all becomes very great."

More Than One Remedy

We have already discussed in this series of articles a few of the proposed remedies for the present distresing tax situation which exists in Michigan today. We have told how the proposed state income tax might largely or entirely replace the general property tax for state purposes. We have discussed the justice and feasibility of raising the necessary revenue for highway construction and maintenance through a state gasoline tax. We have pointed out that what funds are spent must first be raised and have consequently pled for economy. We have shown the fundamental importance of assessment and the absolute necessity of a fair deal between farms and city property. We have called attention to the growing menace of tax-exempt securities and have argued for the abolition of this gross class privilege. We have stressed the importance of having our forestry tax adapted to a long-time crop like timber.

These several remedies taken collectively constitute a fairly comprehensive program of taxation reform. But let no one think that these are the only planks which might be included in a tax revision platform. Many other proposals are being enthusiastically advocated by various groups and organizations. For instance, the Michigan Real Estate Association feels that the way to keep taxes down is to fix by law an absolute maximum amount of money which might be raised by taxation during any given period. They believe that this is the most effective way to approach the problem. According to their scheme it would be necessary for budget makers to fix their appropriations according to the funds available—to cut the garment according to the cloth at hand, as it were.

Limiting Taxes By Law

Now tax limitation is not wholly a new and radical innovation in taxation practice. At least one state, Ohio, has fixed a maximum tax rate. However, the results of rate regulation have not been wholly satisfactory. The reason for this condition is not difficult to find. When the maximum rate as established under such a system failed to bring in the desired amount of revenue it was too easy to increase assessed valuations and thus destroy the entire purpose of the tax limitation statute.

The Michigan Real Estate Association proposes to get around this difficulty by limiting not the rate which might be levied, but the amount which might be raised. While no state has as yet enacted a law following this so-called Michigan idea, it is not, however, without high official endorsement. For instance, John A Zangerle, county auditor of Cayahoga county, Ohio (the county in which Cleveland is located), in a scholarly and comprehensive address delivered before the National Tax Association declared:

"For a number of years I have favored tax rate limitation laws as tending towards public cooperation in securing more vigorous assessments. Not the firm, drastic, inflexible kind, but limitations subject to change by popular vote. Popular votes on tax increases serve to educate the public as to public needs and budgetary requirements and invite support to the assessor's activities.

"However, such laws tend to depress assessments when 'rates' are authorized. When, for example, with a limited tax rate of $1 per $100 the people vote an increase of 5 to 15 mills for 1 to 5 years on the existing duplicate, levied on 50 per cent values, where is the assessor insane enough to suddenly increase real estate assessments 100 per cent. It is obvious, when tax-spending authorities have their avenue of escape, by means of publicly authorized rates, assessment increases must suffer. Under rate limitation laws, amounts only should be authorized, not rates."

Here Is the Plan

To get a clearer understanding of the desires and plans of the Michigan Real Estate Association, let us consider some rather extended extracts from an article which appeared in a recent issue of the Michigan Property Owner, the official publication of the Association:

"To write into the constitution of the State of Michigan a limitation of the amount of taxes that may be levied against real property for state purposes, is a task to which the Michigan Real Estate Association, through its executive committee, has re-pledged its service. Tax limitation will be the major legislative objective of the association before the 1925 session of the legislature. Tax limitation will be the dominating note of the association's tax discussions until the opening of legislature.

"Study (and the study has not been superficial) gives convincing support to the conclusion that the present gross discrimination against real estate in proportioning tax burdens never will be appreciably lessened until real estate is shielded by the state constitution.

"It is against this discrimination toward real estate—a discrimination that levies 79½ per cent of the taxes upon a class of property representing only 35 per cent of the wealth; a discrimination that retards thrift, dwarfs the ambition to own and defend home and falls with blighting severity upon thousands unable to pay—it is against this discrimination that the Michigan Real Estate Association voices a determined protest and pledges anew the vigor of its services. When the discrimination is removed and the proportions of the burden are equitably distributed, the amount of the burden will not be especially troublesome.

"Study seems to indicate that real estate's proportion of the tax burden will not be very satisfactorily adjusted by the remedies most frequently suggested. Economy is advocated and economy should be exercised but lessened expenditures will advantage all classes of important tax payers in about the same degree and will not tend to equalize the load. New sources of revenue are suggested as a relief to real estate but we find little in the experience of other states to support this hope. Almost without exception new incomes have prompted new or greater expenditures. The new income has been consumed and property taxes have continued upward.

To Hobble Taxes

"The Michigan Real Estate Association believes that as a first step property taxes should be hobbled—tied down so that they can't leap. The association would accomplish this by limiting them—by writing it into the state constitution a provision that would say to members of the legislature, 'Gentlemen, you shall not command the real estate of Michigan to pay more than a certain amount in taxes.' The amount would be fixed in dollars. With such a provision

About 200 Attend Feeders' Day at M. A. C.

LIVESTOCK Feeders' Day at the Michigan Agricultural College, Wednesday, June 18th, was attended by about two hundred farmers and feeders, which is a very good number for the busy season of the year. At about 10:30 those in attendance assembled at the hog plant where eight lots of hogs which had just been finished for market were discussed by Prof. G. A. Brown.

From there a visit was made to the work hose barns where nine teams of farm work horses are being fed experimentally on two different rations, one horse in each team receiving corn and alfalfa hay, and, the other horse corn, oats, and timothy hay. Prof. R. S. Hudson discussed the horse work.

The horse breeding barns and paddocks were next inspected. The international grand champion Belgian mare, Pervenche, the junior champion Belgian stallion, Range Line Phoenix, and other prize winning horses of the Belgian, Percheron and Clyesdale breeds were seen under home conditions.

The calf feeding pens were visited last, where three lots of Texas bred calves, had just finished a feeding trial of 190 days length.

At two o'clock the visitors assembled in the Agricultural Building, where Dean J. H. Skinner, of Purdue University, gave a very excellent summary of cattle feeding results at that institution. Their results of 20 years experimental work show some very definite things of value to cattle feeders.

He showed how the ration of corn and timothy, or prairie hay had been eliminated from the practical cattle feeder's farm. The addition of silage to the corn and legume hay ration cheapens the cost of grain. A protein concentrate, cottonseed meal, or linseed meal, also increased the profits.

Some dry roughage was found to be essential in the silage ration. A full feed of corn was found to be more profitable than either no corn feed or a half feed of corn with silage, cotton seed meal and clover hay.

He also gave a summary cost of production of beef covering sixty-two hundred cattle under various conditions in which the original cost of the cattle and the feed cost comprised 87.7 percent of the total cost; the other factors such as labor, interest, taxes, etc., each made up only a small part of the cost. This fact shows that while these smaller items of cost are important in themselves, the most fundamental essentials are to buy right, to feed most economically and to sell well.

Mr. Charles Stewart, Executive Secretary of the National Livestock Producers Associate, Chicago, set out some principles on which that organization stands.

The Producers believe in the terminal market as an agency for marketing livestock and are opposed to direct buying from the farm by the packers. They do not propose to eliminate the middleman, but do believe that some of his methods might well be changed.

They do not depend too strongly on legislation as a means of reform in marketing, except in so far, as to give the farmer and stockman an equal chance with other business. They believe in the National Packers and Stock Yards act. They are willing to give credit to the present marketing agencies for the good they accomplished, but believe their selfish interest will prevent their accomplishing some reforms that the cooperation agencies can bring about. They are depending upon the law of supply and demand as the strong stalilizing force, subject to influence of certain outside facts and believe that through extended organization producers can control the marketing of cattle to the advantage of both the producers and to trade.

Through charts he showed the fluctuations of receipts, top prices and average prices, both by months for 1923, and by years for the past twenty-five years. The September decline in average prices is due to increased receipts of western cattle, he said. It is impossible for feeders to market half-fat steers at that time of year at a profit.

By Culling the Farm Flock You Reduce Egg Costs

Study This Article and Then Cull Out the Boarder Hens in Your Flock

By E. C. FOREMAN

Professor of Poultry Husbandry, Michigan Agricultural College

SUCCESSFUL poultrymen appreciate more and more each year the real value of systematic culling and selective breeding, as a factor of major importance in the economic production of eggs.

Trapnest records show a wide range of production among individuals maintained under identical conditions of housing, feeding, and general management. Thirty per cent of the farm hens lay less than seven dozen eggs per year. Such hens are unprofitable and should be eliminated at this time, thereby saving a seven months' feed bill, because their productive season is limited entirely to the spring and summer months or the low egg price season.

A well bred hen with ability to lay from 180 to 200 eggs per year will produce one dozen eggs on five pounds of feed, at a cost of twelve cents per dozen. She not only excels as an economical producer, but the generous distribution of eggs during practically every month of the year enhances her earning capacity because many eggs are laid during the high price season.

Fortunately the accumulated knowledge resulting from a careful study of individual hens with high and low official trapnest records makes it possible to accurately weed out unprofitable stock and segregate the most productive individuals for foundation breeding stock.

Intelligent culling at this time, means as many eggs from fewer hens. Selective breeding results in more eggs from the same number of hens. Production costs are reduced in either case, but maximum efficiency calls for the application of both.

The two terms, culling and selection, should have ascribed to them somewhat different meanings, according to their general application. Culling of poultry is usually based upon physiological changes that the hen undergoes as a result of production. The weakness of the commonly advocated systems of culling is that the fowls must be retained from six to eight months, sometimes at a loss, before the tests become valuable. Selection for egg production requires a little more skill but also has greater possibilities. Selection involves a close study of type, conformation, temperament and head character.

A comparatively simple but practical method of culling hens at this time calls for the application of the combined capacity, pigment and moulting tests.

The capacity test, commonly used, reflects ovarian activity and has its greatest value in determining present production. Capacity is measured perpendicularly from the tip of the keel to the pubic bones, which are located on each side of the vent.

The contracted condition illustrated in Fig. 1., showing a two finger measurement, indicates the ovary is not functioning and the hen therefore is not in a laying condition. This does not however, indicate the hen has never laid nor that she will not return to production as interputed by the ardent "Hogan Test" enthusiast. For this reason it is necessary to use supplementary tests in order that the real value of such a hen can be properly determined.

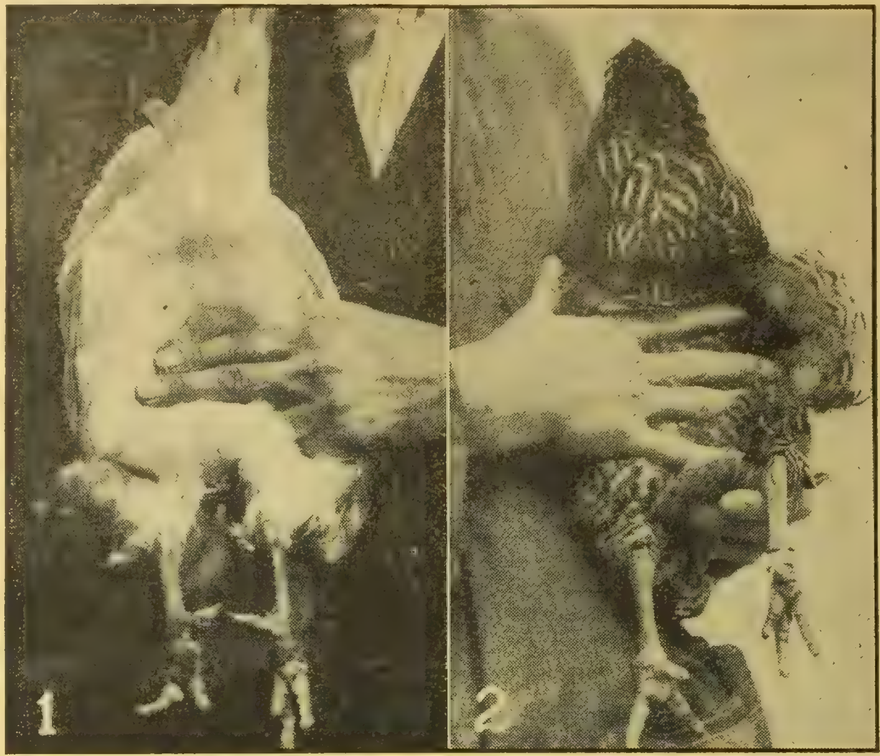

Fig. 1—This hen with two finger measurement is not in laying condition as the ovary is not functioning. Fig. 2—The laying hen with active ovary shows a spread of from four to six fingers.

The laying hen, illustrated in Fig. 2, shows a spread of from four to six fingers, depending somewhat in the breed, size of hen and conformation of the individual. This pelvic region, referred to as the egg sack, should feel full and pliable, and the skin should be fine, elastic and mellow, indicative of good condition and quality.

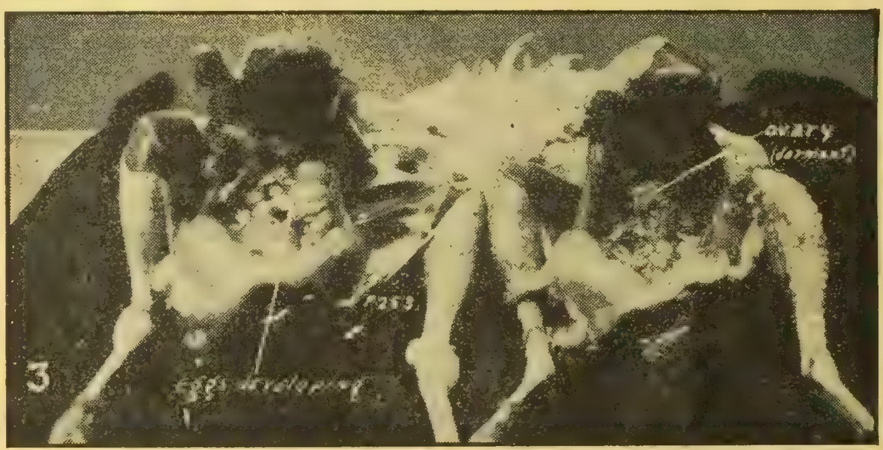

Fig. 3—This reveals the active and dormant ovary common to all hens. When a four finger capacity exists, yolks will be found in various stages of maturity, with five or more yolks well developed.

Figure 3 reveals the active and dormant ovary common to all hens showing measurements similar to those described above. When a four finger capacity exists, yolks will be found is various stages of maturity, with five or more yolks well developed. Such a hen is usually in heavy production. The hen with limited capacity measurement, may possess a normal healthy ovary but may not be laying due to a restricted and unbalanced diet; she may have recently been broody or raised a brood of chicks or she may be a typical cull. The ovary will, in any case, reveal the dormant condition as illustrated by a grape-like cluster of immature ovules, none of which are larger than peas.

A better estimate of the value of such a hen can be quickly determined by the application of the pigmentation test, which is the bleaching process, that occurs during different stages of production in all yellow skinned breeds including Plymouth Rocks, Rhode Island Reds, Wyandottes, Leghorns, Anconas and a few other less popular breeds.

The yellow pigment which is evident on the shanks, beak, ear lobes, eye ring and vent gradually disappears as the individual egg record increases. The pigment leaves in a difinite order disappearing from sections of most rapid blood circulation. This yellow pigment. known as xanthophyll is absorbed and used to color the yolks in the manufacture of the egg.

The yellow ring present or the inner margin of the vent usually disappears after the hen has laid three or four eggs. The creaminess of the ear lobes in the Mediterranean breeds such as the Leghorns and Anconas, will bleach to a white when two dozen eggs have been produced. The horny structures such as the beak and legs release the pigment more slowly, requiring in most cases three dozen eggs before the yellow finally leaves the upper portion of the beak, and from 80 to 100 eggs before the shanks have lost practically all of this yellow coloring matter.

This bleached condition remains only as long as the hens are in regular production and may return with broody periods or longer vacations.

The possibilities of error are very slight if the hens showing only a two or three finger capacity, with yellow legs are culled out. About twenty percent of all farm hens can be eliminated by this very simple culling practice.

The time and rate of moult is the third test that can be accurately applied in determining the profitableness of every hen in the flock. We no longer labor under the delusion of the early moulter filling the egg basket during the winter months. Big records are impossible when production is limited to a few months in the year. It usually requires from ten to twelve months of consistant laying to cover the distance of two hundred eggs or better.

Late moulting and quick moulting are policies of the heavy layer. This type of hen will, as a rule, return to production in from 4 to 6 weeks after the completion of her first year record. The moulting period is usually delayed until the late fall months or subsequent to October first. When the moult is delayed until the latter part of November or early December, special attention should be given such hens for a few days until their bodies are better protected by more complete feathering.

The early moulter usually indulges in a prolonged vacation and seldom returns to production until to long warm spring days return.

For this reason it is advisable to market such hens in July or August, because the few eggs produced the following spring will not pay the previous fall and winter board bill.

The three methods of culling briefly described will enable every poultryman to eliminate all non-productive or unprofitable stock at this time. The feed bill will be reduced one third, eggs more economically produced, and the proper hens marketed.

A careful practice of selective breeding will on the other hand,

FORTY YEARS OF FAKING

The Memoirs of a Grafter—By Himself

THE master grafter, Pete Dexter, has run his course. Just like the calf that hanged itself when it got too much rope, Pete has gone the limit and then is jerked up with a bang that ends his career. But he pulls a good one before he goes down with all on board.

Last issue Pete told how he got into a popular game of making money off of anxious inventors. He made good, thanks to the assistance of a doubtful lawyer, and got away without trouble. Then he noticed what a good thing there was in the baby chick business. He was just getting nicely started and was making money again at the close of the installment. But Pete was working on an excellent deal at the last when he ran up against the law. You will enjoy reading how he ended his famous game and and life of crime.

CHAPTER IX

WE got along fine till about the middle of the summer, when I began to get kicks from customers. One fellow wrote that his Black Langshans were full of red feathers, and another fellow said his Barred Rocks looked more like fighting cocks than anything else. Well, I was not surprised, for I knew what my hatchery was buying for setting, but I stalled along and tried to tell the customers a lot of stuff about heredity. But it was too much work. I had made an honest living that summer, and all the customers had got baby chicks that ordered them, and I couldn't see why I should worry further, so I decided that the easiest way out was to pack my trunk and move.

Anyway, I had my eye on a big deal. Two safe moves on my part and I was getting back my nerve, and the new scheme had the makings of some real cash.

Tracing Back Old Estates

It happened this way. One day while I was loafing in the office, I happened to be reading a New York paper which told of the trouble the Astor Estate was having over an old claim someone had against them in which the original Indian title was being put up as evidence that the Astors were not entitled to the big bunch of property they had.

At the time I commented to a fellow by the name of Rasmus Smith about the matter, and he began to tell me how he was distantly related to Captain John Smith, of Virginia, and how he had an old trunk that was filled with old deeds that had been handed down thru his family for hundreds of years. I asked him if he would bring the trunk of stuff down to the office, as I was curious, and he agreed. As long as the trunk was small, I drove up to his place and loaded the thing into my car and we came back to the office and the inspection began. Those papers were sure interesting. They were so old a fellow could hardly read them, and they were decorated with seals that made our diplomas look sick. Late that night, after I had looked them all over, I got an idea. It was a dandy:

It probably might be wise to state at this time that Mr. Rasmus Smith was the type that was easy to work on. When I got thru talking to him, he was of the opinion that he was the direct heir to most of Virginia, and when I asked him if he would help me in establishing the titles and would let me keep the records he had, say, he fell for the game immediately. So I organized right then and there the "John Smith Heirs' Association." I was the president and Smith was the secretary, and we agreed that if I could establish his title, which I was sure I could do, he was to get one-third interest. I was to get a third for my work, and we then decided to sell the other third to any of the multitude of Smiths that were scattered all over the United States. Rasmus Smith as secretary was to travel around later on and tell the people about the scheme, and of course I was prepared to fix up the facts regarding the case which would help us. I might add that Smith was so sold on the deal that he began to spend the money we were going to get long before I was ready to begin operations.

Having plenty of money, I did a little investigating. I first looked up the history of old John Smith and made a few trips to Virginia, gathering details and posting myself on the section Smith lived in back in 1600. I also checked up the land grants he received from the English king, and found that there was plenty of land to talk about.

About six months after the hatching of the plan we were ready to begin. I placed a few ads in various city papers and a few with big rural circulations, asking that any Smiths who had formerly lived in Virginia get in touch with me. Replies came in from all parts of the United States, and I'll bet that if Virginia had all those Smiths back again, New York would lose her rank as the leading state in population. Many of them gave me facts regarding their families which helped us a lot, and after we had the lists made up, I addressed them with a circular letter.

I told them of the important discovery—how I had chanced upon the trunkful of records in the possession of Rasmus Smith, and how I was sure, after careful investigations, that we could establish a title to thousands of acres of Virginia land and a large part of the city of Richmond. I made it good and faked a story of how old John Smith had been unlawfully deprived of this land, and that with the records I had on hand I was prepared to prove absolutely that the present heirs were entitled to the titles of this valuable property. Then I told them that it would take a lot of money to finance the court actions and investigations, and while we were sure we could eventually prove the titles, we would have to do a lot of work.

I told how I had arranged with the direct heir for the shares, and how any Smiths, who would come to our aid, could get in on a third of this vast estate by subscribing $25 to our association. Of course the people who established a direct line of heirship would have an interest if we won the case. But I thought it would be a good plan to help defend the titles and then there would be no chance for disputes. Believe me, the Smiths came thru.

As soon as we could arrange for the matter, we started in to form John Smith clubs in the cities. Maybe you belong to one. I fixed up a speech; had Rasmus Smith learn it, and gave him a few of the old weather-worn, worm-eaten records out of that trunk and sent him out to lecture to the clubs. I took care of the office work till he got back, and every time Smith went to a city more members joined the association. I also hunted up an attorney I had met in Washington and hired him. He was sent out to lecture, and while we worked quietly, we sure had the Smiths organized like they never were before. I studied genealogy pretty hard that year, and in the spring I was able to go out to the Smith clubs and report on the case.

Of course we were making progress, but it took a lot of money, and at the close of every meeting I passed the hat for funds to help the cause, and I sure took up generous collections.

Then I started to sell interests at $5 each to friends of the Smiths, and promised them that one million dollars of the estate, when we got it, would be divided among the holders of these "participants' interests," and it was easy to show that a $5 share would pay about a hundred for one.

Keeping the Smiths Enthused

When I got back to the home office, business was so good I had to hire more help, and I spent three months organizing the business. Once a month, I would send out a circular to our mailing list and give a report, and I went down to Virginia and actually filed a suit in a small town and gave the local paper a big check to write it up our way. Then I had these papers sent to every interested member of our association. Soon the city papers copied the story, and I had reprints of the favorable articles made and sent them out. This kept the Smiths enthused for over a year, and gave me a chance to get the money in the bank.

Early the next spring, I sent out a letter to our members and told them we had all the records clear but one, and we would have to go to England for that. This would take a lot of cash, as English courts require fees in a different system to ours. I attached a coupon which gave every person who contributed to this fund an additional share in a tenth part of the other one-third which was being set aside at this time for such an emergency. Estimates prepared by me showed the estate to be worth around seven hundred millions, and most of these coupons came back. Shares in this division sold for $5 each, and we sure had the money.

I was planning a trip to England with the idea of settling over there, and had the funds of the association converted into securities that I could handle easily when things began to happen. How I hate to think of that day! One morning a fellow arrived at my office. He was a peaceable sort and wanted to talk, so I began. He wanted an interest in the association, and I sure gave him the stuff. When I got thru, he coughed a bit and smiled funny and left. I wondered who he was and no one in town that I met later in the day seemed to know what train he came on or when he left. That afternoon when I went to get my mail I asked the postmaster if he had seen the fellow who called on me. Some how, I was feeling shaky. Say, I was shakier when the postman right quick says, "No, I didn't see him, what did he want?" I smelt smoke and that night I threw all my bonds, which I had safely kept, in my strong box and took the 2 a. m. train for Boston. I figured I could leave a few thousand in the bank and if I could get to Montreal I could get a steamer for England and would not have to worry further.

I got to Boston all right and got a train shortly afterwards for Montreal and thought I was safe. About 10 o'clock the next morning when the train stopped in a little town, two fellows got on the train. One of them was my caller of the day before and as pleasantly as before he asked me, "Whither bound?" Well, I got off at the next station, and back we went. He was a federal agent and I was nabbed again for using the mails to defraud.

I spent a lot of money for lawyers. I had enough bonds to go my own bail but nothing worked out right. After a few months, in which I tried once to get away again, a judge looked hard at me and quietly said, "Five years in the prison at Atlanta."

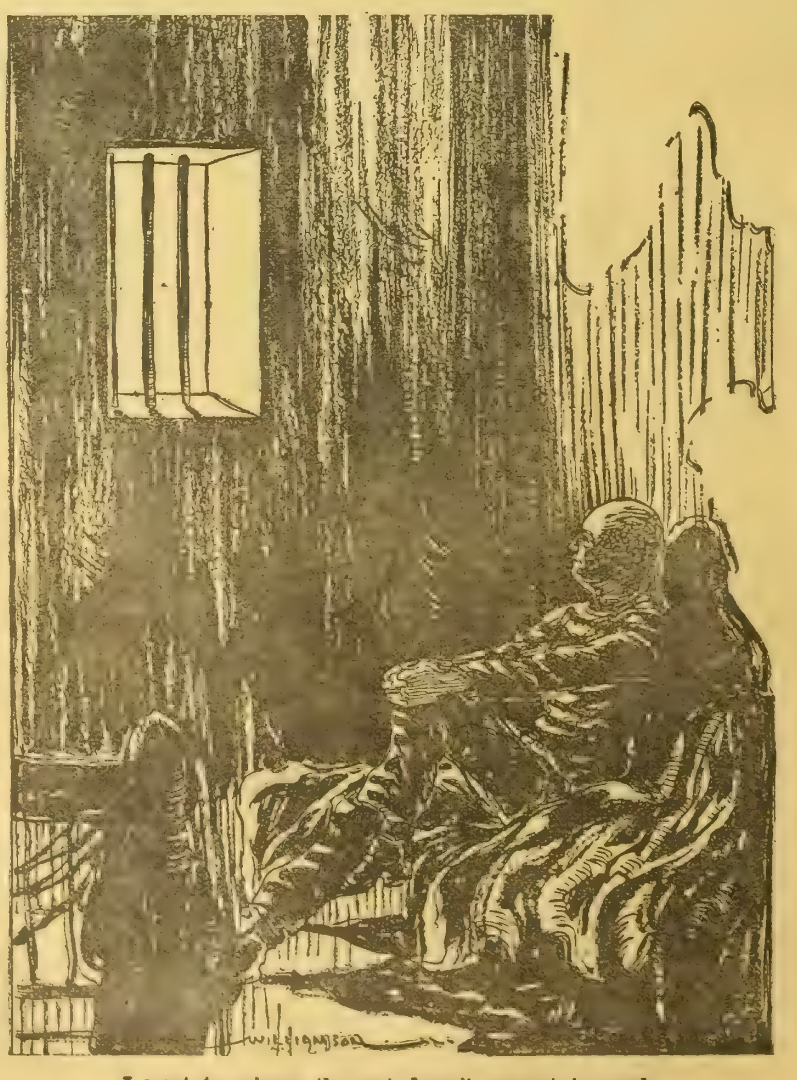
The rest doesn't amount to much. The Smith Heirs Association fizzled. The funniest part was that Rasmus Smith, whom I thought was the "dub," managed to escape with a big roll. He had been collecting on his own hook and when the evidence was shown in court Rasmus had cleaned up a nice $75,000 and beat it.

I went to prison. My career there was like others who happened to be stopping at the institution during my visit.

The only good luck I have had since I landed in prison was the appearance of my almost forgotten friend Blake. I was taken sick at the end of my second year in prison and everyone, including myself, thought I was going to die. One day I wrote a letter to Blake and asked him if he would take care of some affairs for my old aunt. He did it and best of all he started the ball rolling which got me freed. Blake was now a congressman. He had stepped out of the patent business and got into politics and when he heard from me he came to my rescue. Blake got me a job as a gardner and when I am well enough I manage to dig around the plants enough so I can at least get my board. I have to report to a federal judge once every six months and it's quite a different life than I have been used to living. I am old and worn out and I can't believe that I am the same fellow who used to live so easy.

Once I was rich, in fact I was rich many times, but I just can't get any ideas any more. No use anyhow as the judge keeps pretty close track of me. So I dig away and it's a pretty tough layout at the best. But I have learned that a fellow can fool 'em all part of the time but not all of 'em all the time and I hate to think that after my forty years of prosperity I am down and out. After all I guess I got what's coming to me.

(The End)



I went to prison; the rest doesn't amount to much.

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

NO SCHOOL ON SATURDAY

My boy has passed all the lower grades and is now in the 8th grade and is doing good work by his report card. Can the teacher make him take 6th grade arithmetic? She made them (the eighth grade) take 7th grade history and now they are nearly thru the 8th grade history and she says she is going to review them in the 6th grade history yet. They have so many studies that they have to do their arithmetic nights at home. She is going to have school on Saturday for the 8th graders to do arithmetic. I do not want my boy to go to school on Saturday. We have spoken to the county commissioner several times about it. He said they had not ought to have those extra studies but he has not done anything yet. Would it be my place to interfer?—Mrs. S. A. R., Mullet Lake, Mich.

EIGHTH grade pupils should thoroughly review work of previous grades when such review is necessary. The teacher should be the judge of the necessity of the review. The school law provides that no public school shall be maintained on legal school holidays nor on Saturdays.—G. M. Otwell, Supt. of Rural Education, Dept. of Public Instruction.

CHILDREN LIABLE FOR MOTHER'S SUPPORT

A husband and wife in Michigan were divorced in 1887. Neither remarried. In 1915 the husband died and his property was divided by law among his children. The wife still survives and has a little property of her own. She is extremely childish and unreasonable and a guardian is being asked for her as she is unfit to do business or attend to her own needs. If she becomes dependent will any of her children be obliged to support her? Her state of mind is such, none of them can live with her, though the only daughter has done all a daughter could. All are in moderate circumstances and very hard working people. Some reside in the west.—F. H., Petersburg, Mich.

IF the mother becomes unable to support herself, her children would be liable for her support. An arrangement should be made under which each child would contribute equally to her support.—Asst. Legal Editor.

LAW IS SILENT AS TO WHO PAYS BILLS

In case of a strict quarantine as in scarlet fever where both parents are in the quarantine who is obliged to pay the bills for food, fuel and doctor? Is not the county obliged to pay these? Our health officer tells us the county will pay these bills and now our supervisor says that our county has a new rule and we will have to pay our own bills and living expenses.—M. C. K., Clinton County, Mich.

THE law is silent as to who shall pay for supplies furnished persons in quarantine. The law provides that no person shall be permitted to suffer for the necessities of life by reason of quarantine, but there is no direct provision as to who should pay for the same.—W. J. V. Deacon, M. D., Michigan Department of Health.

INDORSER MUST RECEIVE NOTICE

On February 1921 was a public auction sale by A. B bought some things and asked C to sign his note. Now C was sure the note was paid as he never received notice about it not being paid. The note was for one year. About two months ago C was told by A that the note was not paid. Now can C be made to pay the note as a signer although not being notified when the note was due?—S. D., Perrington, Mich.

THE indorser on a note is not liable for the payment of the amount of the note, unless he is given notice of the maker's failure to pay it when due, provided, however, notice is not waived.—Asst. Legal Editor.

IS PROPERTY EXEMPT FROM TAXATION

May I ask for a little information through your paper? I am a widow, in the sixties, my health is not good. I have a farm of about fifty acres with a mortgage. Because of the mortgage I have to work for my living. I have children and they have their own loads to carry and I cannot burden them and have no will to do so. I was told recently that the party speaking knew of several widows whose property was exempt from taxation and she thought I needed and deserved the exemption as much as they. If I was exempt from taxation it would be a great help to me. Will you please tell me if it is possible and how I should do to bring it about? Thanking you, I am Mrs. V. T. W., Charlotte, Mich.

THE statute provides for the exemption from payment of taxes, persons who, in the opinion of the supervisor of the board of review, are too poor to pay taxes. It also provides for exemption from payment of taxes on a homestead, up to the value of $1,000.00, of widows of soldiers or sailors who served in the Spanish American, or Civil Wars.—Asst. Legal Editor.

CAN VOTE ONLY IN DISTRICT WHERE RESIDES

I live in one school district, own property and pay taxes. I send my child to a school in adjoining district where I own property and pay tuition. Have I a vote in the district where my child attends school?—Mrs. M. C., Custer, Michigan.

THE parents or guardians of children of school age who own property and pay school taxes in more than one district may send their children to the school in any district in which they pay taxes. However, a school elector has a vote only in the district in which he has an actual residence. One of the qualifications for electors in all school elections is three months actual residence in the district immediately preceding the election.—G. N. Otwell, Dept. of Public Instruction.

PAYS MORTGAGE TAX

In 1919 I bought a city lot of A on contract. Last December the state tax commissioner notified A that there was a mortgage tax due on this contract of ½ of 1 per cent which A paid. A has notified me that he paid the tax for me and I am to pay him. The clause in the contract under which A claims it is my tax reads as follows: "The buyer also agrees to pay all taxes and assessments levied or assessed upon said land all special revenue or deficiency tax of any nature whatsoever after date hereof; and the buyer agrees to exhibit receipts therefore to seller whenever so requested; and the buyer hereby purchases said real estate upon these terms and agrees to pay said sums when due and perform all the conditions of this contract." The date of this contract is July 9, 1919. The contract is not all paid up yet but I am making payments when due. Who should pay this tax?—J. R. L., Tecumseh, Mich.

THE question as to who should pay the mortgage tax would be determined by the interpretation of the tax clause in the contract. If the vendee merely agrees to pay all taxes of whatever kind on the land, the vendor would have to pay the mortgage tax. If the vendor desired the vendee to pay the mortgage tax, it should have been so stipulated specifically in the contract.—Asst. Legal Editor.

DID NOT FIX WELL

Last fall we had a man here to fix our well and he finally gave it up and said the screen could not be set as there was a hole in the pipe. He drove the pipe down 8 inches and left it there. He really did harm to the well. In a few days another wellman came and inside of 5 hours he had water for us and the well has worked good ever since. We have four witnesses that the well was fixed in this length of time. We have paid the first man $10.25 and still owe him $17.75. Can he collect this balance? The second well man claims that the first well man cannot collect the wages at all as he failed to fix the well. Please give us your advice on this matter. —Reader, Grand Traverse County, Mich.

UNDER these circumstances, I am of the opinion you would not be required to pay the first man the balance which he claims, in view of the fact that you say he did the work improperly and did harm to the well.—Asst. Legal Editor.

WOULD WIFE HAVE TO SIGN DEED?

My brother and myself have a joint deed of forty acres of land. Now he is married and I am to buy his half. Does his wife have to sign off too? If he should die would his half go to his wife? Can I will my half to some of my relatives?—R. C. C., Arcadia, Mich.

A WIFE has no right of dower in her husband's interest in an estate held by joint tenancy, he therefore could convey his interest without the necessity of her signing the deed of conveyance. If your brother and yourself hold a deed to the land which conveys it to you as joint tenants, upon his death you would be entitled to all the property as survivor. Neither party could devise his interest by will to his relatives or anyone else. —Asst. Legal Editor.

OUR READERS' NEW BUILDINGS

Have you built any up-to-date farm buildings lately? If you have send us a picture of the new building and we will print it in this new department. It will show the M. B. F. readers what their distant neighbors are doing to change the scenery. And, incidently, you may be able to help some farmer decide the type of house, or barn, or other buildings he desires to put up. He may like the appearance of your building and will want the plan of it. Kodak pictures are all right if the details show up well. Do not send the negative, just a good print.

ON THE FARM OF MRS. MATTIE ELLISON, SPARTA, MICHIGAN

This looks like a new barn but it isn't and it is. It was started in 1860 and finished in 1923. "The timbers for a 30 ft. by 40 ft. barn were hewn but the builder's work was interrupted by the Civil War," writes Mr. Fred Ellison of Sparta, Michigan. "He did not return after the war so others finished the work. In 1911 the barn was moved about 15 rods and placed on a concrete basement. In 1917 an addition of 20 ft. was made on one end and the old structure was resided. Then last year, or 1923, the old roof was taken off and a new gambrel roof built. The present dimensions are 30 ft. by 60 ft. with 16 ft. lower posts and 16 ft. purline posts. The basement has a concrete floor and stalls, box stalls and stanchions installed. The cost of the work done since 1911 has been about $1,500." The barn is located on the farm of Mrs. Mattie Ellison, of Sparta, Michigan.

METHOD OF VOTING WAS LEGAL

On election day at the township meeting a motion was made and supported, for a township nurse. It was decided by the chairman of the board to have the people file past the election board and they count those for or opposed. It carried by two votes. I understand there were several people that would not wote when they saw how it was to be done. Was it a lawful method of voting on such a question?—W. H. P., Northport, Mich.

UNDOUBTEDLY the question was one on which a viva voce vote could be taken. Section 2157 of the Compiled Laws of 1915 authorizes the moderator to have the voters polled or divided when any seven or more of them object to his determination of a question decided by a viva voce vote. In the absence of proper objections made by the electors at the time of voting, we believe the method of taking the vote would be at most an irregularity concerning which no question could be legally raised after the meeting adjourned. The electors might have determined to take the vote in some other manner had they so desired by making a motion to that effect.—Clare Retan, Deputy Attorney General.

MORTGAGE GOOD FOR 15 YEARS

Kindly give me information about a personal note given with a mortgage. I bought a team of horses, wagon, 2 sets of harness, plow, wagon-box and few other articles amounting to $100.00 plus interest at 7 per cent. I gave as security on mortgage for above articles a cow. Nothing paid down. I gave personal note for $100.00 drawn for 11 months. I was never notified by holder of the note and mortgage being due or past due. Is the personal note valid after 11 months expires and how long is it good for? How long is a mortgage good for, three years?—H. C., Rose City, Mich.

YOU, as maker of the note would be liable on it for a period of six years from date of maturity. A mortgage is good for 15 years.—Asst. Legal Editor.

TO APPEAR IN COURT

I am a subscriber to the M. B. F. and have been for several years and will give it a boost wherever I can. Would like to have you answer the following questions. Would you send me a copy of a legal summons to appear in Circuit Court where a person sued anybody for damages? How soon would papers have to be served before date of court? Would date of hearing have to be set when to appear? How must be filled out, signed, dated and sealed? Who is to serve the papers and must he sign the summons? Where they are served on man and wife must they be dated the same to be legal? Please let me hear from you at once.—F. J. L., Ceresco, Mich.

THE party served is required to appear within fifteen days after service of the summons. The summons must be signed by the clerk and given to the sheriff who serves it and makes his return on the back of it as shown on the blank summons enclosed. If man and wife are sued jointly the summons should be dated the same for each one.—Asst. Legal Editor.

CAN TAKE POSTS

I bought a place three years ago and when I took the place there was a pile of posts on it. They are here yet. Can I hold the posts? I have sold out and am moving off. I do not want something that is not mine but the man I bought from took advantage of me when I bought from him.—J. H. M., Durand, Mich.

I think you would be justified in taking the posts along with yon.—Asst. Legal Editor.

How Concrete Helps the Farmer

Farmers who have the advantages of permanent, expense-proof buildings save time and money that would otherwise go to keep ramshackle buildings fit for use. Concrete dairy barns mean healthier cows that give more milk; and that means bigger milk checks.

Concrete silos make possible economical, dependable feed the year 'round—which also means more milk.

Concrete manure pits prevent loss of valuable fertilizing elements in manure.

Concrete corn cribs keep out rats and mice. You can't sell these pests so why fatten them?

Concrete feeding floors and hog houses make healthy, profitable hogs.

Concrete protects the home, and other farm buildings against fire.

Wouldn't you like to know more about Concrete—how to mix and use it, and how to estimate quantities of materials? We will gladly send you this information without charge, if you will write and let us know what you are planning to build. Why not write today?

Our booklet F-14 tells all about the uses of concrete on the dairy farm. Send for your copy.

What the Neighbors Say

TAX RIDDEN

DEAR EDITOR:— Why are we farmers forced to pay county agents and nurses? White collared farmers who ride around in autos and tell us what to raise; who never farmed any and learned farming through books and college. If the supervisors had any feeling for the farmers in their districts, they would say, "Let farmers vote on it and help us lower our taxes."

It is the women and children on the farms who are denied things that are needed, because it takes everything to pay taxes. Yet farmers wives are in need of what is paid to county agents and county nurses.

We use to live without them and could dress respectable and fix up our homes. Now it is pinch, pinch, pinch and give up every penny to pay taxes.—Farmerette, Kalamazoo County, Michigan.

STICK TO THE FARM

TO the Editor:—I read the article by Ralph Jordan in your March 1st issue. He says it is not the bright lights of the city that is calling the farmers from their farms, but better conditions. Is it better conditions to work in a stuffy factory, cooped up like rats, than to work out in God's free air? He says it is only the strong, determined farmers that are leaving the farms for better conditions. That does not apply to this territory. He says others cannot get away because they can't leave their old parents that are worn out by years of slavery and misery. Who is the slave? The man that works for himself and can go to work and stop when he gets ready, or the man that must be on the job when the whistle blows, and must do just as the boss says, and has no say of his own. He says the farmers are waiting for some poor boob to come along and buy their farms, so that they can go to town. If the poor boob is the right sort of a man, he will be a successful farmer 10 years from now, and the man that goes to town will be the poor boob, working under a boss and will be just where he started.

Let me give you the history of two men here about 20 years ago. One of them lived in town, was a mechanic and always got the largest wages, he owned a good house and lot. The other man had worked and got about $300. If he had gone to town he could not have got over half as much wages as the other man, but instead he went in debt for a farm, and he and his wife have worked hard to get along. Today they own a good farm, good buildings, good stock, and good machinery, and if he was to sell all he has he could clear up about $10,000. The other man has eaten up his house and lot, and is living in a rented house. If he was to sell their home and furniture and clothing, they could probably get $300, but he has a little advantage over the other man, as one has a big tax to pay, and the other has nothing to pay taxes on. What is the matter with a good many of our men? They want five and six dollars pay for one dollar's work, and they can't work for themselves, but must have a boss over them.—Harold Johnson, Barry County, Mich.

WHY HAVE COUNTY AGENTS?

DEAR Editor:—Mr. H. E. Coblentz asked this question in THE BUSINESS FARMER of April 12th. I would ask Mr. Coblentz why is an efficiency expert necessary to big business? He would probably answer, that it is vital that work should be done with the least possible expense, and the efficiency expert can point out the remedy. So with the county agent. He is the efficiency expert of the farm.

The county agent is better educated along agricultural lines than the majority of farmers. The national and state agricultural departments keep in touch with him. He is up in the latest along farm lines. You will say, of course, that the national and state agricultural departments will send their literature to the individual when asked. But does the individual stop to read and study this literature?

Business progresses and changes their methods. Sometimes the new method proves unprofitable, so they change again. So with farming. Potatoes did not prove profitable during these last few years, but dairying doubtless will. Dairying is more stable than potato raising. It is not only the county agent that advocates this, but all the big men on farming.

Probably the farm agent does wear a white collar, and doesn't assist you during potato digging, but this is worth listening to. Mr. Coblenz says: "We are paying too many white-collar fellows, running around at our expense." No clothes don't make the man, nor do overalls make the man.—Dorothy Dill, Traverse City, Michigan.

Uncle Rube Spinach Says:

"THEY'RE NOMINATIN' 'EM NOW"

THIS is the season of the year when they nominate pres'dents, leastways fellers 'at want to be pres'dents, an' up to now (June 21) they've got jest two—one for pres'dent an' a vice. Now a vice pres'dent cuts 'bout as much figger as a rat in a mouse trap, but we have to have one to make the ticket look good, so the 'Publicans (an' sinners) have nominated Coolidge and Dawes, Hell & Marias Dawes. Well there's more conventions commin' off an' more men'll be nominated. There'll be more candidates 'an any one, men or women, can vote for—fact is there'll be more'n any one would want to vote for.

No matter who they nominate, none of 'em'll be any to good for the job 'cause its quite an important positon, as a pres'dent has full charge of the White House—when his wife ain't home, an' the Mayflower, which means the pres'dential yacht, an' has a chance to talk to congress once or twice a year an' draws a purty fair cash salary, an' has egg rolling on the lawns, an' some times keeps a goat—if he don't have one, he makes his secretary take his place, or somebody else takes it—there always has to be a goat, you know.

However, now that conventions are in season, I hope folks won't forget Bill Bryan, an' me. Yes, I've always kinda hankered for the job, an' then there's LaFollette from Wisconsin. No I wouldn't want him runnin' mate—rather see him go alone—but McAdoo kinda wants a chance, or Al Smith, he's a democrat with a wet tongue—he would like to get a few votes. Oh I guess there'll be plenty of cand'dates an' so I ain't argin' my case none. Fact is I'll withdraw if they'll give me the salary or Muscle Shoals, or somethin'.

I guess its quite an honor to be president, cause a pres-dent can ride all over the country in a private car, an' make speeches, when he can find people to listen to him, an' his wife is head lady of the land, an' can boss him around, an' dress in beads an' jewels, an wear bobbed hair, or otherwise, jest as she wishes, an' make him take a bath twice a month or more, as occasions require. An' he can have oyster pie or not, jest as he sees fit—an' once in a while he sends a message to the people that all is goin' well, an' he's boss in gen'ral of most everything he knows or don't know, an' so forth.

So that's why I've thrown my hat into the discard an trust that folks will rest easy as I don't hardly expect to get anywhere near the nominatin'. I'll stay with Uncle Bill Bryan an' some of the down-an'-outers, an' wishin' you all a good fat job, I am, Cordially yours, UNCLE RUBE.

RADIO DEPARTMENT

By J. Herbert Ferris, R. E.

STATIC AND SUMMER RECEIVING

THERE are many nights that the atmospheric electricity is so strong that it spoils all reception of broadcasts. This is due to the fact that every discharge of electricity sends out electrical waves and your receiving set picks them up and you hear them as crackling or roaring noises in your receivers.

With a little patience you can soon take advantage of these troublesome noises and forecast the coming weather sometimes two days in advance. Certain sounds always preceed coming rain or thunder storms. It is a pleasant way of spending a few minutes each day by listening to these discharges and then watching the coming weather, and after a few times you will be able to tell the kind of weather to expect on the following day.

A short aerial, an inside aerial (in your attic) or a loop will do away with a great deal of this atmospheric or static trouble. It is surprising what a little difference there is in volume of received signals by using an inside aerial, and a great difference in the amount of static disturbances that spoil your reception.

It might be well to mention here that the large radio manufacturers will pay a big price, yes up to a half million dollars, to the man who invents a real static eliminator that will sell at a reasonable price. All the big men are working on this problem and as yet no satisfactory method has been discovered.

WEEKLY BARN DANCE

YOU radio fans who like the old fashion barn dances, the dances where we used to have the time of our lives and danced till darn near daylight, can live those old days over again and have as good a time as ever. Have your neighbors come over Saturday night and then take your receiving set out to the barn and tune in on the Sears-Roebuck Agricultural Foundation Broadcasting Station WLS any time after 9:10 P. M. Eastern standard time. You'll hear the old tunes come through the air, the same old tunes we used to "step" to. And you can dance till 1:00 o'clock in the morning.

RADIO PROGRAMS

Station KYW, Chicago. Central standard time 8:20. Wave length 536 meters.

Oh Money! Money!

by ELEANOR H. PORTER

Copyright by Houghton Mifflin Company

(Continued from June 21st Issue.)

"SHE doesn't dare to. Besides, there's Hattie. She says Hattie is always telling her what is due her position, and that she must do this and do that. She's being invited out, to the Pennock's and the Benson's; and they're worse than the maid, she declares. She loves to go to places and spend the day with her sewing; but that these things where you go and stand up and eat off a jiggly plate, and see everybody, and not really see anybody, are a nuisance and an abomination."

"Well, she's about right there," chuckled Mr. Smith.

"Yes, I think she is," smiled Miss Maggies; "but that isn't telling me how to make her contented."

"Contented! Great Scott!" snapped Mr. Smith, with an irritability that was as sudden as it was apparently causeless. "I didn't suppose you had to tell any woman on this earth how to be contented—with a hundred thousand dollars!"

"It would seem so, wouldn't it?"

Something in Miss Maggie's voice sent Mr. Smith's eyes to her face in a keen glance of interrogation.

"You mean—you'd like the chance to prove it? That you wish you had that hundred thousand?"

"Oh, I didn't say—that," twinkled Miss Maggie mischievously, turning away.

It was that same afternoon that Mr. Smith met Mrs. Jane Blaisdell on the street.

'You're just the man I want to see," she accosted him eagerly.

"Then I'll turn and walk along with you, if I may," smiled Mr. Smith. 'What can I do for you?"

'Well, I don't know as you can do anything," she sighed; "but somebody's got to do something. Could you—do you suppose you could interest my husband in this Blaisdell business of yours?"

Mr. Smith gave a start, looking curiously disconcerted.

"B-Blaisdell business?" he stammered. "Why, I—I thought he was—er—interested in motoring and golf."

"Oh, he was, for a time; but it's too cold for those now, and he got sick of them, anyway, before it did come cold, just as he does of everything. Well yesterday he asked a question—something about Father Blaisdell's mother; and that gave me the idea. Do you suppose you could get him interested in this ancestor business? Oh, I wish you could! It's so nice and quiet, and it can't cost much—not like golf clubs and caddies and gasoline anyway. Do you think you could?"

"Why, I—I don't know, Mrs. Blaisdell." murmured Mr. Smith, still a little worriedly. "I—I could show him what I have found, of course."

'Well, I wish you would, then. Anyway, something's got to be done," she sighed. "He's nervous as a witch. He can't keep still a minute. And he isn't a bit well, either. He ate such a lot of rich food and all sorts of stuff on our trip that he got his stomach all out of order; and now he can't eat anything, hardly."

'Humph! Well, if his stomach's knocked out, I pity him," nodded Mr. Smith. I've been there."

"Oh, have you? Oh, yes, I remember. You did say so when you first came, didn't you? But, Mr. Smith, please, if you know any of those health fads, don't tell them to my husband. Don't, I beg of you! He's tried dozens of them until I'm nearly wild, and I've lost two hired girls already. One day it'll be no water, and the next it'll be all he can drink; and one week he won't eat anything but vegetables, and the next he won't touch a thing but meat and —is it fruit that goes with meat or cereals? Well, never mind. Whatever it is, he's done it. And lately he's taken to inspecting every bit of meat and groceries that comes into the house. Why, he spends half his time in the kitchen, nosing 'round the cupboards and refrigerator; and, of course, no girl will stand that! That's why I'm hoping, oh, I am hoping that you can do something with him on that ancestor business. There, here is the Bensons', where I've got to stop—and thank you ever so much, Mr. Smith, if you will."

"All right, I'll try," promised Mr. Smith dubiously, as he lifted his hat. But he frowned, and he was still frowning when he met Miss Maggie at the Duff supper-table half an hour later.

"Well, I've found another one who wants me to tell how to be contented, though afflicted with a hundred thousand dollars," he gretted her gloweringly.

"Is that so?" smiled Miss Maggie.

"Yes. Can't a hundred thousand dollars bring any one satisfaction?"

Miss Maggie laughed, then into her eyes came the mischievous twinkle that Mr. Smith had learned to watch for.

"Don't blame the poor money," she said then demurely. "Blame—the way it is spent!"

CHAPTER XVIII

Just a Matter of Begging

True to his promise, Mr. Smith "tried" Mr. Frank Blaisdell on "the ancestor business" very soon. Laboriously he got out his tabulated dates and names, and carefully he traced for several lines of descent from remote ancestors. Painstakingly he pointed out a "Submit," who had no history but the bare fact of her marriage to one Thomas Blaisdell, and a "Thankful Marsh," who had eluded his every attempt to supply her with parents. He let it be understood how important these missing links were, and he tried to inspire his possible pupil with a frenzied desire to go out and dig them up. He showed some of the interesting letters he had received from various Blaisdells far and near, and he spread before him the genealogical page of his latest "Transcript," and explained how one might there stumble upon the very missing link he was looking for.

But Mr. Frank Blaisdell was openly bored. He said he didn't care how many children his great-grandfather had, nor what they died of; and as for Mrs. Submit and Miss Thankful, the ladies might bury themselves in the "Transcript," or hide behind that wall of dates and names till doomsday, for all he cared. He shouldn't disturb 'em. He never did like figures, he said, except figures that represented something worth while, like a day's sales or a year's profits. And, speaking of grocery stores, had Mr. Smith ever seen a store run down as his old one had since he sold out? For that matter, something must have got into all grocery stores; for a poorer lot of goods than those delivered every day at his home he never saw. It was a disgrace to the trade.

He said a good deal more about his grocery store—but nothing whatever more about his Blaisdell ancestors; so Mr. Smith felt justified in considering his efforts to interest Mr. Frank Blaisdell in the ancestor business a failure. Certainly he never tried it again.

It was in February that a certain metropolitan reporter, short for feature articles, ran up to Hillerton and contributed to his paper, the following Sunday, a write-up on "The Blaisdells One Year After," enlarging on the fine new homes, the motor cars, and the luxurious living of the three families. And it was three days after this article was printed that Miss Flora appeared at Miss Maggie's, breathless with excitement.

"Just see what I've got in the mail this morning!" she cried to Miss Maggie, and to Mr. Smith, who had opened the door for her.

With trembling fingers she took from her bag a letter, and a small picture evidently cut from a newspaper.

"There, see," she panted, holding them out. "It's a man in Boston, and these are his children. There are seven of them. He wrote me a beautiful letter. He said he knew I must have a real kind heart, and he's in terrible trouble. He said he saw in the paper about the wonderful legacy I'd had, and he told his wife he was going to write to me, to see if I wouldn't help them—if only a little, it would aid them that much."

"He wants money, then?" Miss Maggie had taken the letter and the picture rather gingerly in her hands. Mr. Smith had gone over to the stove suddenly—to turn a damper, apparently, though a close observer might have noticed that he turned it back to its former position almost at once.

"Yes," palpitated Miss Flora. "He's sick, and he lost his position, and his wife's sick, and two of the children, and one of 'em's lame, and another's blind. Oh, it was such a pitiful story, Maggie! Why, some days they haven't had enough to eat—and just look at me, with all my chickens and turkeys and more pudding every day than I can stuff down!"

"Did he give you any references?"

"References! What do you mean? He didn't ask me to hire him or anything."

"No, no, dear, but I mean—did he give you any references, to show that he was —worthy and all right," explained Miss Maggie patiently.

"Of course he didn't! Why, he didn't need to. He told me himself how things were with him," rebuked Miss Flora indignantly. "It's all in the letter there. Read for yourself."

"But he really ought to have given you some reference, dear, if he asked you for money."

"Well, I don't want any reference. I believe him. I'd be ashamed to doubt a man like that! And you would, after you read that letter, and look into those blessed children's faces. Besides, he never thought of such a thing—I know he didn't. Why, he says right in the letter there that he never asked for help before, and he was so ashamed that he had to now."

Mr. Smith made a sudden odd little noise in his throat. Perhaps he got choked. At all events, he was seized with a fit of coughing just then.

Miss Maggie turned over the letter in her hand.

"Where does he tell you to send the money?"

"It's right there—Box four hundred and something; and I got a money order, just as he said."

(Continued on page 21.)

Politics and the Railroads

To the present generation of Michigan Railroad men it is a grateful thought that this Peninsular commonwealth is appreciative of the fact that Railroad Service is today the best in Michigan history.

We know this appreciation by actual expressions—spoken and written—and by the gradual disappearance of that ancient hostility which featured an era of Railroading long past.

Most people realize that Railroad Service has been re-established despite laws which restrict management in every detail—laws which add huge burdens of expense to Railroad operation without assisting in any way toward Railroad progress or the development of Railroad Service.

Those who understand these facts give full credit for the achievement of Michigan's twenty-four steam Railroads and are prompt to resent selfish attacks on them. Before this defense—a defense based on facts—railroad aspersion is becoming out of date, except for spasmodic revivals at election time, when office seekers, desperately fighting for votes, sometimes endeavor to turn Railroad abuse into political capital.

Railroads have small chance to meet such attacks. Railroad men are too busy furnishing transportation and conducting negotiations with the various Government boards and commissions which so closely supervise our every act. In this extremity we must rely on you to protect and defend us, and to insure us a square deal.

Is this reliance well placed?

"We Serve Michigan"

THE ONE HUNDRED TENTH PSALM
OR THE CHURCH'S PROGRAM

A SERMON BY REV. DAVID F. WARNER

"1. Jehovah saith unto my Lord, Sit thou at my right hand, Until I make thine enemies thy footstool.
"2. Jehovah will send forth the rod of thy strength out of Zion: Rule thou in the midst of thine enemies.
"3. Thy people offer themselves willingly in the day of thy power, in holy array: Out of the womb of the morning Thou hast the dew of thy youth.
"4. Jehovah has sworn victory and will not repent: Thou art a priest forever after the order of Melchizedek.
"5. The Lord at thy right hand will strike thru kings in the day of his wrath.
"6. He will judge among the nations; He will fill the places with dead bodies; He will strike thru the head in many countries.
"7. He will drink of the brook in the way: There will he lift up the head."

THE Great War is over but the conflict for righteousness is on in dead earnest. The liquor men are showing the red eye of defiance as their iniquitous business is doomed. Politicians are opposing an international agreement to minimize the probabilities of war. And many classes and peoples are crying for justice in this new day of unrest. And now the church has no other and brave choice but to move forward in vigor and purpose with her healing and salvation.

But, in this day, when we are the more yielding to the impact of spiritual forces, set loose nineteen hundred years ago by the Man of Galilee, we are the clearer seeing that righteousness consists not so much in claiming and getting justice, but in giving justice. The late Woodrow Wilson indicated that every country, participating in the League of Nations, must give up something of its sovereignty, that is, make concessions to other nations. This is social righteousness. The key-principle of Christianity is GIVING, not GETTING.

Now, this is a forward moving principle and ideal by which to begin to live in this age. How many ideas there are, but how few the ideals! An idea becomes an ideal when we are willing to clothe it with sacrifice and devotion! when we enshrine it in flesh and make it live before men; but still more, perhaps, when we are willing to die for it. Jesus and St. Paul were moved by the eternal "must" and there lives went out as the martyr's price. Lincoln yielded to the assassin's bullet for an ideal, and Edith Cavall gloried in death at the hands of her cruel enemies.

Psalm 110 sets forth the church's program. Luther calls this Psalm "the true, high, main Psalm of our beloved Lord, Jesus Christ." In verse one we have the present and universal reign of Christ. His atonement is finished. His spirit has been released for men; and the conflict for truth shall rage until the restoration of all things. This is a time to die for others. "Except a grain of wheat fall into the ground and die, it abideth alone." Jesus quotes this psalm in Matthew 22:44. It is convincing proof of his Messianic power on earth,—a sovereignty which he makes the surety of the Great Commission.

Verse two represents the church as waging the conflict. "Zion," to the Jew, is the earthly Jerusalem, or Judaism. But to the Christain, it is the spiritual Jerusalem, or church. "The rod of thy strength" is the rod with which the prophets and the Revelator saw Jesus smiting the nations or the Word of God. The Gospel has gone out to gather the whole world to its embrace. The Kingdom of God is to be won by the church wielding "the Sword of the Spirit." Christ must rule in the midst of his enemies. They must be subdued by the power of the Gospel thru the church. In this dispensation the world's sins must be blotted out by the blood of the Lamb, thru heralds that are willing to die to declare the news.

During this dispensation, Jesus is to remain in heaven. When the church's task is finished he returns again, but not as a mediatorial Savior. Then the door of salvation will be closed (Matthew 25:10). Our hope lies in present action. And now is the time to answer Christ's prayer for unity, and to join in the Revelator's universal chorus: "Unto him that sitteth on the throne and unto the Lamb."

And for this glorious consummation God's people are willing to labor, for this is the day of the church's power, says verse three. This psalm is the war cry of our Great Commander, calling the church to mobilize against the enemy. These soldiers of Christ are to have the vigor characterized by "the dew of youth." It is a world struggle. It involves every man and every man's affairs. You can not be neutral. There is no God and Mammon in this movement. Either you are willing or not willing. But the call is to the willing, —to the volunteers. No drafted men are wanted. What a wonderful situation! There is no place in Christ's army for a conscript. Already we have too many of such in the church. When the call comes for an advance and assault, we are compelled to send out corporals to line up the church's forces.

And what have you when these church professors are lined up? Many times, nothing. They won't fight. They look like soldiers, maybe, but they belie the name. With such an army, defeat is certain. When Gideon reviewed his thirty-two thousand men, his close eye detected the fearful and the unwilling, and he said, "Go home; we can't use you." He had but three hundred left. They were volunteers that had the splendid conception of their leader and the same stout faith in God. Every Bible reader knows how the sword of Jehovah and Gideon won. If the battles of the church are lost, they are lost to the fearful, the neutrals, and the conscripts. But heaven pity that soul and that church in the day when God shall loose the winds of judgement, if they are not found bravely fighting! "By the water courses of Reuben there were great resolves of heart." Foch said, "Send me volunteers whose hearts are hot for the fight." And this is fundamental in the success of our militant warfare. It is an assured fact that no conscript or sluggard shall enter the Kingdom of God.

A guarantee of victory is sounded in verses four to seven. Jesus has gone into the great Holy of holies as a "priest forever" to offer his life as a moral satisfaction for the world's sins. But the world must know this. The church must declare it. How long? "How long, O Master, the holy and true, dost thou not judge and avenge our blood on them that dwell on the earth" (Revelation 6:10; compare Luke 1: 8,9,21)? "And the people were waiting for Zacharias, and

(Continued on page 19.)

The New OLIVER Plow for the FORDSON

Fordson plowing was a step in the elimination of plowing drudgery. In the new Oliver No. 7-A you will find another important forward move in better plowing, easily accomplished.

You will find the Oliver No. 7-A different —so simple in construction, so easy to operate. It will penetrate in hard soils as in more favorable conditions.

When you see this plow, note the exceptional clearance which permits good plowing in trashy fields. See how a powerful screw sets the depth and allows the bottoms to be raised clear of the ground even with the plow standing still. Grasp the handy controls which permits all adjustments from the tractor seat. There is a power lift, of course.

Wheels, not landsides, carry the weight of the plow, making lightest draft and even depth furrows so desirable for a good seed bed. The hitch can be rigid or flexible as your field requires.

As for the work of the plow itself—we ask you to see it and compare it with your exacting standard of quality plowing.

RELIABLE ADVERTISERS

We will not knowingly accept the advertising of any person or firm who we do not believe to be thoroughly honest and reliable. Should any reader have any cause for complaint against any advertiser in these columns, the publisher would appreciate an immediate letter bringing all facts to light. In every case when writing say: "I saw your advertisement in The Michigan Business Farmer!" It will guarantee honest dealing.

"The Farm Paper of Service"

RECOGNIZING AGRICULTURE

"IN dealing with agriculture, the Republican party recognizes that we are faced with a fundamental national problem, and that the prosperity and welfare of the nation as a whole is dependent upon the prosperity and welfare of our agricultural population."

The foregoing is the opening paragraph of the agricultural "plank" in what is referred to as the "Coolidge platform" adopted by the Republican party at its recent convention in Cleveland.

Ordinarily we don't take much stock in platforms; like New Year's resolutions, they are easy to make, but durned hard to carry out. Nevertheless we feel differently about the Coolidge platform, because it is not the platform of a group of professional politicians for the main purpose of corralling votes. It is a platform of a man whose honesty of purpose and determination to do the right thing in spite of what effect it may have on him politically has never been questioned. Moreover, the President himself is a product of the soil, understands the farmers' problems, appreciates the importance of the farming business, and is making a sincere effort to help the farmers of America. Incidently, his father declined an invitation to attend the Cleveland convention because he was too busy putting in the crops on his Vermont farm.

If you have not read the Agricultural plank in the Coolidge platform you should do so, and then compare it with what the Democrats will offer the farmers after they meet in New York.

This is not a stump speech for the Republican nominee; we are content to let his record in office speak for itself. It is not the policy of THE BUSINESS FARMER to take sides in political campaigns; we merely want to point out to you what we believe has an honest purpose behind it, and not the bubblings of a group of politicians, for obviously Calvin Coolidge and not the professional politicians were in the saddle at Cleveland. We would not under any consideration take the responsibility of telling you to vote for Mr. Coolidge, the Democratic candidate, or any man a third party may put into the field, but we will go so far as to say that if you want to return Calvin Coolidge to the White House, vote him a Congress that will work with him, and that does not block every turn he makes. No president can give the country the right kind of administration unless he has Congress behind him.

THE BOARDER HEN

THE term "boarder", which is often applied to cows whose production is so low that it barely pays their board, applies also to the hen that "eats her head off." As a matter of fact, the farmers probably keep more boarder hens than they do hens that really produce a profit. As a usual thing, farmers pay little or no attention to the productive ability of their flock of hens, to say nothing of making a selection of individuals of high productive ability.

This is regrettable to say the least, because poultry is one of the most profitable sidelines in farming. No matter what type of farming is followed, whether it is grain farming, dairy farming, fruit farming, general farming or whatnot, poultry usually fits in to good advantage.

Did you ever stop to think that the most expensive hen you can have on the farm, is the one that lays the fewest number of eggs? A hen that lays seven dozen eggs per year, requires almost as much food as one that produces from fifteen to seventeen dozen eggs per year. In other words, the former will require an average of twelve pounds of feed to produce one dozen eggs, while the latter will produce one dozen eggs on five pounds of feed.

If you are interested in poultry as a profitable farm sideline, don't fail to read the article in this issue by Prof. E. C. Foreman on the value of systematic culling and selective breeding of poultry, as a factor of great importance in the economic production of eggs. Incidently Prof. Foreman is one of the outstanding experts and authorities on poultry husbandry, and we feel particularly fortunate in being able to present to readers of THE BUSINESS FARMER such a worth while discussion on this important subject. Prof. Foreman's article is based on facts gained from study and experience that will be exceedingly valuable to anyone who applies them.

Prof. Foreman points out that systematic culling and selective breeding results in more eggs from the same number of hens. The cost of producing eggs will be reduced in their case, but a maximum efficiency calls for the application of both. In other words, when you have culled your flock in accordance with the instructions given, the job is only half done; you should follow that up by selective breeding.

Unfortunately hens are just hens to a great many farmers when they could be made a very interesting study, as well as a profitable sideline —and Prof. Foreman tells how it may be done.

We appreciate, however, that most farmers feel they have so many things to look after, they are unable to give poultry the attention it rightly merits. This offers a suggestion. Why not get the farm boy, or the farm girl, or both, interested in taking hold of the poultry department on the farm and running it in a scientific way. It is not only good experience for the young folks, but there is no reason why, in many cases, the poultry end of the business should not pay part or all of their education.

The poultry on the farms of Michigan is too much neglected, and we urge THE BUSINESS FARMER readers to give it more serious attention. When we read Prof. Foreman's article we got real enthusiastic about it. Perhaps that is largely because we particularly like poultry, but entirely aside from the fact that, we believe farmers are making a serious mistake not to go after the poultry end of their business in a real scientific way.

KEEP THINGS IN BALANCE

"A TIME to keep things in balance" in a few words sums up the view of the U. S. D. A. Bureau of Agricultural Economics, in a statement issued June 1. In the opinion of the Bureau, "If reasonable balance is maintained in the production end, agriculture as a whole stands to gain the greatest economic leverage since 1919". These are encouraging words, to say the least.

Not only in Michigan, but over the country generally, the spring has been late, and farming got away to a slow start, but as each week rolls by, conditions are rapidly improving, and the indications are that the season will not be so bad after all. The labor situation tends to grow easier, if anything. Also the general level of prices shows a declining tendency, while farm products have slightly advanced. What we need, of course, is more and still more of this balancing-up process between agriculture and industry. There is bound to be a balancing up sooner or later, but we sometimes weary of the long drawn out process, especially if we happen to be in the unfortunate position of hanging on by the skin of our teeth, as it were.

The Bureau of Agricultural Economics points out that two underlying factors now color the agricultural situation. In the first place, the program of agricultural production has arrived at the best general balance since 1920. The community at large hardly understands how far-reaching and skilful a readjustment farmers have made in the major lines of production. They have obeyed economic signals as expertly as any industry ever did. Naturally, however, it takes a much longer time to bring about a readjustment in agriculture than it does in the manufacturing industry. It is pointed out that no board of directors can shift over night the crop system and growing animals on six million farms.

Now that the readjustment process is coming along in good shape, let us watch our step. It is very important to recognize the point when readjustment in the various lines has gone far enough. In other words, if you have achieved a balance, don't upset it. As a result of this survey the United States Department of Agriculture points out, that the tendency this season is to overdo poultry, corn, butter, and potato production, and it may presently cut down too far on wheat, cattle and hogs. The real production situation frequently changes some time before that fact is registered in price changes.

The second underlying factor in the agricultural situation is that the annual industrial boom of the past few years appears to be slowing down at the present time; what that will probably result in will be a balancing-up process between industry and agriculture. If the city buys less of manufactured products, it apparently means, under present circumstances, some lowering of prices of things that farmers have to buy, and likewise a lowering of wages.

Of course, a slowing up in industry may create a somewhat narrower market for such products as lambs, butter, fresh eggs, and semi luxury fruits and vegetables, but we rather doubt that this will be serious, and anticipate that it will be more than offset by the benefit that will accrue to agriculture, as the result of the balancing-up process. There is nothing to indicate an impending depreciation in industry; it is simply a slight slowing up that we do not believe is serious, at least so far as the effect on agriculture is concerned.

KEEPING TAXES DOWN BY LAW

"COULD Our Tax Totals Be Held Down By Law?" is the heading on the current installment of the series of articles on taxation in Michigan by Stanley M. Powell. The idea of holding tax totals down by law is sponsored by the Michigan Real Estate Association, and the way this can be done, they state, is to fix by law an absolute maximum amount of money which might be raised by taxation during any given period.

This idea is not entirely new. The state of Ohio has a law somewhat along this line but it has failed to work wholly satisfactory. The Michigan Real Estate Association has made a study of the Ohio law, has found the weaknesses and believes it has a law that will work perfectly.

During the past several months we have discussed tax problems here in Michigan and, in turn, taken up and explained some of the many remedies offered. The state income tax has been discussed and since petitions have been circulated by the leading farmers organizations of the state and enough signatures secured to assure the proposed income tax law being put on the ballot this next fall. Then it will be up to us whether it becomes a law or not. A gas tax, tax exempt securities, as well as several other remedies have been discussed. The remedy offered by the Michigan Real Estate Association is not supposed to be a panacea for all tax ills —they do not claim it is—but it will, they believe, help solve the problems of real estate taxation. City, school and county taxes would have to be taken care of but by holding down state taxes it would be a step in the right direction, and it would be up to the counties and cities to work out their problems. If it will help solve the problem it is worth considering because there is much help needed.

IN THE BIN OR IN THE STACK?

IT won't be long before those readers of THE BUSINESS FARMER who have grain to thrash will be visited by the custom thresherman.

Are you going to have him put the grain his machine threshes in the bin or in the stack? That is a foolish question, isn't it? No, it isn't; it is a mighty serious question. So serious is it that the United States Department of Agriculture has recently issued a statement calling attention to the fact that the careless, inefficient operation of threshing machines is responsible for a great many bushels of wasted grain.

Threshing machines have been built and improved for a great many years, and while none of them are probably one hundred per cent efficient in the separation of the grain from the straw, yet any of them will do their work with very little wasted grain if kept in good condition, properly adjusted, furnished with the proper amount of power, and carefully watched while in operation. In addition to this of course, the grain itself must be in condition to be threshed.

If a threshing machine fails to separate all the grain from the straw, it is usually due to one or more causes; either the machine is not being run at the proper speed, the cylinder fails to thresh all of the kernels out of the heads, the separating mechanism is not level, or the blast not properly adjusted.

You can depend upon it that the owner of the threshing rig is not so thoroughly interested in getting every bushel of grain from the straw as you are, and therefore it is important for the farmer to be on the alert. It is well to be versed on the operation of the machine, and to know whether the separator man has his machine adjusted for the most efficient results possible. Furthermore, it is not so important for you to watch the grain spout as it is what is coming out of the wind stacker; the straw pile or stack is the most important place for the owner of the crop to be.

PUBLISHER'S DESK

RULES FOR TESTING INVESTMENTS

IN a recent issue of Printers' Ink there was an article on blue-sky swindles and in this article 10 rules for testing an investment were given. The rules given are very good and we are passing them on. Read 'em and then paste 'em in your hat or put up in some prominent place where you can refresh your memory every now and then.

(1) When a stock salesman tells you "now or never," the answer is always "never." Good investments will be here tomorrow. Get sound advice before you buy.

(2) Don't try to combine gambling with investment. The more interest, the more risk.

(3) Don't buy swamp land 1,000 miles away. If you buy real estate, buy right near home.

(4) Watch out for the man who offers a big stock bonus. It's cost many folks their life savings.

(5) Don't invest in another man's dreams. Be especially suspicious of the man who tells you how much a $100 investment in original Ford or telephone or other similar stock is worth now. For every big winner many more fail. A man who has discovered a diamond mine doesn't tell the world about it. Out of every 100 new businesses started, 87 fail and only 13 prove successful!

(6) Mining costs big money. Shun the man who tells of the mountains of gold that beckon on the blue horizon.

(7) If you must gamble, gamble on yourself. Don't play the other man's game.

(8) Don't stay on the sucker list. If strangers write offering to make you rich, tell them to remove your name from their list. Get off the list. Some of those birds can write.

(9) Crooks take advantage of every invention. Watch out now for fake radio stocks.

(10) Most fake promoters use the money from stock sales paying running expenses. Buy mahogany furniture for your own house instead of for a bucket shop.

FOOD AND FUR OFFICIAL GETS JAIL SENTENCE

WE advised in our last issue that officials of the Standard Food and Fur Association had got themselves in wrong with Uncle Sam and had been arrested and charged with using the mails to defraud. Since then they have been brought to trial and one official, Nathan D. Hecht went to jail for six months and two others, James and Thomas Vavaro, were acquitted by a jury. In addition to the six months he must spend in jail Hecht had to pay a fine of $1,000. The other officials claimed that Hecht deceived them in the sale of the business two years ago. Like Pete Dexter of "Forty Years of Faking" this man Hecht finally got caught.

OLIVER OIL-GAS BURNER

"I would like to know whether the Oliver Oil-Gas Burner gives satisfaction or not and wish you would advise me.—M. H., Lenawee County, Mich."

WE have published many letters from subscribers regarding the Oliver Oil-Gas Burner, we are of the opinion that it depends considerable on the user whether the burner is a success or not. It seems that about 50 per cent of our readers who purchase these burners are satisfied, while the other 50 per cent are very much dissatisfied, and would not use them under any consideration.

WYANDOTTE OIL COMPANY

"I am writing to ask you if you could give me any information on some oil stock that has come into my possession. I have 500 shares at $5.00 a share in the Wyandotte Oil Company of Venango county, Pennsylvania. The company was incorporated in 1864 and it seems that their offices were in Pittsburgh. Is the stock of any value?"

A THOROUGH investigation reveals that this company was organized in 1864 and at that time owned 21 acres in President township, Venango county, Pennsylvania. The incorporators were Edward G. Peabody, A. M. Ross, J. P. Chandler, W. C. McKibbon and Henry R. Anderson. Bankers in Oil City and Franklin, Pa., never heard of the company and do not know any of the incorporators. About the year 1864 there were a great many of these incorporations organized, due to the excitement at that time, and more than likely this company was one of them. Most of the companies of this kind let their land go at tax sales when it was discovered there was no oil under them, and but few of them still own land. From the above information we would conclude that the stock is not worth much.

MAKING APRONS AT HOME

IF any of our readers are making aprons and selling them "at a profit of $6.90 to $15.30 per dozen" for the Mary Jane Apron Company of Manitowac, Wis., we would like to hear from them.

We wrote this company in March asking them for the names and addresses of any ladies in Michigan who made a success of their plan, but altho they sent a full line of their circular matter, they sent no satisfied customers' names.

They ask $1.50 in advance for the instructions and material, so their scheme does not cost as much as some of the "work-at-home" schemes we have been writing up recently in this column.

ANOTHER NEW ONE

THESE fake stock salesmen are mighty foxy chaps and between personal calls, mails, telephone calls and telegrams the average farmer has a hard time getting rid of them. Unless he losses his temper and uses his boot on that part of the salesman's anatomy the little boy called "the back of his lap". Down in Ohio they have uncovered a new scheme. The farmer is offered "service" from a New York concern. Following a mail campaign the farmer receives a telegram stating that a certain curb stock can be bought at a very low figure and will soon advance to double or more the amount paid. One farmer stated that this concern offered a certain curb stock at $1.25 declaring that it would soon go to $3.00. Quick action was urged, and a long distant telephone call with further urging followed. This particular stock was investigated and found to be worth 50 cents. No doubt they will try to work Michigan shortly so be on your guard; you may find something in your mailbox tomorrow. Do not throw the papers away but send them to us because we want to study their methods. No we are not going into the business—we want to keep them from doing business among our readers.

RENEWING INSURANCE POLICIES

ANY of our subscribers who secured accident insurance last year through THE BUSINESS FARMER and want their policy renewed can have them renewed by writing to the North American Accident Company, 208 LaSalle St., Chicago, Ill. Your check or money order should be made payable to that company.

The Collection Box

The purpose of this department is to protect our subscribers from fraudulent dealings or unfair treatment by persons or concerns at a distance.

In every case we will do our best to make a satisfactory settlement or force action, for which no charge for our services will ever be made, providing:

1.—The claim is made by a paid-up subscriber to The Business Farmer.

2.—The claim is not more than 6 mos. old.

3.—The claim is not local or between people within easy distance of one another. These should be settled at first hand and not attempted by mail.

Address all letters, giving full particulars, amounts, dates, etc., enclosing also your address label from the front cover of any issue to prove that you are a paid-up subscriber.

There are special evening and night rates that make your calls very economical.

MICHIGAN BELL TELEPHONE COMPANY

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

DEAR FOLKS:—The other evening I attended high school graduating exercises here in Mt. Clemens with a dear friend of mine, who had a seventeen-year-old boy who was receiving his diploma. As we sat in our seats and watched the boys and girls, one by one, walk up onto the stage and receive their diploma I could not help but think how swiftly time passes. 'Twas but only a few years ago she, my friend, and I had gone through practically the same ceremonies and now we were sitting there watching her boy graduate from high school. And but a few years, no doubt, and he will be watching his son or daughter receive their diploma.

When we were young one who had a high school education was well educated and pointed out as "real smart" or "an educated fool" according to who discussed them. But now it is different. A college training is the ambition of the young generation. There is a very true saying I always keep foremost in my mind that I want to pass on to you. It is "Slumber not in the tents of your fathers. The world is advancing. Advance with it." So let's not go to sleep but advance with this world of ours and send the boy or girl graduates to college this fall. Sometimes it may require "pinching" a little here and there but it will be money well invested if you can send out your boy or girl well equipped to fight their way.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

BE A FRIEND

Be a friend. You don't need money:
Just a disposition sunny;
Just the wish to help another
Get along some way or other;
Out to one who's unbefriended;
Just the will to give or lend,
This will make you someone's friend.

Be a friend. You don't need glory,
Friendship is a simple story.
Pass by trifling errors blindly,
Gaze on honest effort kindly,
Cheer the youth who's bravely trying,
Pity him who's sadly sighing;
Just a little labor spend
On the duties of a friend.

Be a friend. The pay is bigger
(Though not written by a figure)
Than is earned by people clever
In what's merely self-endeavor.
You'll have friends instead of neighbors
For the profits of your labors;
You'll be richer in the end
Than a prince, if you're a friend.

SOME MEAL POINTERS

THE first course for each meal should tend to stimulate the appetite and prepare the digestive tract for the remainder of the meal. This is especially true of breakfast, and fruit is generally used for this purpose. Fruit is also frequently used for the first course in a luncheon or dinner. Soup has stimulating qualities and is used for a first course.

The next course should consist of a mild flavored food, for example, in the case of breakfast, a cereal. This bland flavored course is followed by the main course, which usually contains the principal building and repair foods, (protein) and the energy and heat producing foods, (starch). The salad course then follows in case of a luncheon or dinner, supplying principally body regulating and body building foods in the form of minerals, organic acids, etc.

The meal ends with a desert and beverage. The physiological reason for ending the meal with a dessert is that a pleasant sensation tends to continue digestion. A good habit to get into is less pies and more fruits for desserts.

For everyday living the meals are not usually served in so many courses, as referred to above, and one or more of the foods mentioned may also be omitted. The principal of contrasts, etc., should be carried out somewhat, no matter how plain or simple the meal is.

ARTIFICIAL RESPIRATION

MY, my, but it is warm—no, it is hot, positively hot—today. I have been all over the house trying to find a cool place where I might do my writing, but there doesn't seem to be a breath of cool air anyplace. After supper tonight we will drive out along Lake St. Clair and enjoy the cool breezes, and where this is a public beach we will find the water alive with bathers.

Everyone, whether they go wading or swimming, should know how to perform artificial respiration. Every year there are thousands who lose their lives while in bathing and many of them are taken from the water while their is still life in their body but they die because of the immediate need of proper treatment—and not one in the crowd knows what to do. I am going to tell you how to treat a drowning person so that if you are called upon some day you will be ready to do your part.

Lay patient on stomach, face turned to one side, so that the mouth and nose do not touch the ground.

The operator should kneel, straddling the patient's hips or by either side of the hips, facing the patient's head.

Place spread hands upon the lower ribs of the patient and throw body and shoulders forward so as to bring weight heavily upon the lower ribs of the patient. Continue downward pressure three seconds then suddenly remove hands.

Repeat this act indefinitely about twelve times a minute—the danger is that in the excitement the rate will be too rapid.

The efforts at resuscitation should be continued until the arrival of the physician. Any evidence of returning breathing should encourage the operator to continue his efforts. Artificial respiration should be continuous for one hour; much longer, if there are any evidences of returning animation.

As soon as artificial respiration has been started, a second party may pull the hair, dash cold water in the face, loosen the clothing and collar and hold a cloth saturated with aromatic spirits of ammonia near the nose.

Spanking the buttocks sharply may also have a quickening effect; pulling on the tongue helps bring the man to. See that the mouth contains no tobacco nor spittle.

No stimulant nor liquids of any kind should be administered by the mouth while respiration is suspended. Keep back the crowd.

FEEDING THE BABY

THERE is nothing "just as good" as mother's milk. It is the natural and only perfect food for the infant. Substituting anything else for it should be considered a serious undertaking, justified only by necessity and carried out only under the advice of a physician.

If mother is ill or run down she should consult a physician before giving her baby other food or bottle feeding. The quality of mother's milk may be improved by improving her health. Improper food, irregular meals, lack of rest and sleep, too frequent or too prolonged nursing weaken the mother and injure her milk, especially in hot weather.

Breast-fed babies often vomit or have diarrhea because the mother is sick or tired out and her milk is poor. So long as the mother keeps well the breast-fed baby will be well.

Tea and coffee do not improve the quality of the mother's milk, and may be injurious to the baby. A nursing mother should drink plenty of pure water. There is no better food for the mother than good milk; she should drink it freely.

If breast milk does not agree with the baby, do not wean him until you have tried:

Improving the quality of the milk by attention to the mother's diet, intake of liquids and details of her daily life.

Feeding the baby at her regular four-hour intervals.

Shortening the length of single feedings.

Giving one-half of one ounce of boiled water before each nursing.

Giving some cow's milk diluted after one or more feedings, if breast milk is scanty.

HOW VEGETABLES RANK IN FOOD VALUE

THE following list of vegetables arranged in the order of their value may be helpful to the home-maker who is eager to secure from vegetables the greatest contribution they have to offer:

1. Spinach, turnip tops, chard, wild green leaves, cabbage, lettuce, string-beans.
2. Potatoes.
3. Carrots.
4. Onions, cauliflower, celery.
5. Parsnips, turnips.
6. Sweet potatoes, beets.
7. Asparagus, Brussels sprouts.
8. Cucumbers, eggplants, peppers, pumpkin, squash.

Leaves, including string-beans, hold the most conspicuous place among all the vegetables, because they are rich in all the materials for which vegetables rank well. Those which are eaten raw have no successful competitors among any foods so far as vitamins are concerned. Although it is true that a serving of roots or tubers, leaves have more than twice as much iron and in many cases they are much richer in vitamins.

It is fortunate indeed that the potato has survived the dietary changes of civilization, because it is a close second to leaves in the food materials that it contains. It is fair in iron and vitamin A and good in vitamins B and C. Carrots also hold an enviable place among the roots because they are good in vitamin A and fair in B and C. Parsnips and turnips are unusual in their content of lime and good in vitamin B.

WORTHWHILE CURTAIN HINTS

SHORT Curtain Defects Overcome—A relative of mine moved to a new house where some of the windows were much longer than the ones in her former home. At first she thought she would be obliged to buy new curtains, but, by the advice of a neighbor this difficulty was entirely over-come.

Instead of new curtains, she used the old ones by measuring from the sill up and letting the rods come wherever they would. Then she purchased some pretty drapes with a valance at the top and placed another rod for these at the top of the window as usual, thereby concealing the shortness of the curtains underneath.

Beautiful Drapes from old material—A friend asked me to step in her bedroom and see her new curtain drapes. I did so, and saw some beautiful plain delicate pink ones with a valance at the top. I examined the material and decided it was some kind of voile, but she laughingly told me she had only taken the outer portions of some old thin worn out sheets and colored them a dainty light pink color.

This discovery has been of great help to me, as I know what disposition to make with sheets that had worn through in the center yet the other portions were strong enough to last a long time.—E. M. L. B.

DO YOU KNOW—

So many housewives make another task while doing one? Never uncover a frying pan to turn meat without first drawing it back to cool a moment. Then raise lid on side towards you and reach under to do the turning, thus preventing any grease from spattering the range for later cleaning.

That you can prevent foods and fruits from boiling over on your burner by watching a few minutes until boiling is reached to see if it will go higher? Then regulate for safety.

That soap will spoil the enamel on your burner? Polish off each day with a clean cloth and a few drops of "3-in-1" oil or "Finoil."

That navy beans are better soaked over night? Drain, add more water, and baking soda the size of a bean, boil 15 minutes. Drain again, cover with cold water. To 2 quarts beans (soaked) add ½ cup sugar (brown preferred) salt and pepper to taste, and several

TIME-TABLE FOR CANNING FRUITS AND TOMATOES

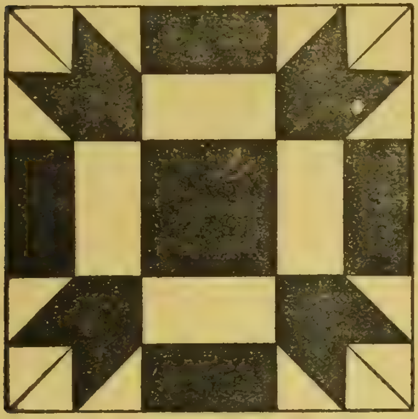
These time periods are based on the use of quart glass jars. For pint glass jars 5 minutes less time may be used, and for No. 2 or No. 3 tins 10 minutes less. When the fruits are precooked and packed hot, a 5-minute process is recommended for all cans or jars to insure keeping and to create a vacuum seal.

Product	Method of treatment before processing	Processing period, at temperature of 212° F.
Apples	Slice, quarter, or halve, then pack in jars and cover with boiling sirup.	Packed cold: 20 minutes.
	Or boil whole in sirup, or bake as for serving, and cover with sirup, and pack hot.	Packed hot: 5 minutes.
	Or pack hot in form of apple sance.	
Apricots	Same as peaches	
Blackberries	Pack in jars. Fill with boiling hot, medium sirup.	20 minutes.
Blueberries		
Dewberries		
Huckleberries		
Logan Black-berries		
Raspberries		
Cherries	Pack in hot jars, cover with boiling sirup, using thick sirup for sour cherries, and medium for sweet.	Packed cold: 25 minutes.
	Or remove pits, add sugar as desired, bring to boil, and pack.	Packed hot: 5 minutes.
Currants	Same as berries	
Gooseberries	Same as other berries, but using thick sirup.	Packed cold: 20 minutes.
	Or prepare sauce, using sugar as desired. Fill hot.	Packed hot: 5 minutes.
Peaches	Scald, dip into cold water, and peel. Cut into size desired, removing pits. Fill jars, then add sirup of desired consistency, in which several cracked peach pits have been boiled.	20 minutes.
Pears	Pare and cook for 4 to 8 minutes in boiling medium sirup. Pack hot in jars and fill with the boiling sirup.	20 minutes.
Pineapples	Peel, core, remove eyes. Cut into convenient sizes. Pack in jars. Fill with boiling thin sirup.	30 minutes.
Plums	Prick. Fill in jars. Cover with boiling medium sirup.	Packed cold: 20 minutes.
	Or bring to boil, using sugar as desired. Fill hot into jars.	Packed hot: 5 minutes.
Rhubarb	Cut in half-inch lengths. Add one-fourth as much sugar as rhubarb by measure. Bake until tender in covered baking dish. Pack in hot jars.	5 minutes.
Strawberries	To each quart add 1 cup of sugar and 2 tablespoons of water. Boil slowly for 15 minutes. Let stand overnight in kettle. Reheat to boiling. Fill jars hot.	5 minutes.
Tomatoes	Scald and peel. Pack whole or cut in pieces. Cover with hot tomato juice. Add 1 teaspoon salt to each quart.	25 minutes.

slices of pork. Bake in a moderate oven, stirring occasionally. Or boil until tender using sufficient water to make soup if desired.

If beans are boiled in a deep kettle, dumplings may be cooked in the soup. For ten small dumplings, use a full cup of sweet milk, one heaping teaspoon of baking powder sifted in with enough flour to make a stiff dough and a scant teaspoon of salt. Drop dough in soup (in spoonfuls.) One hour before beans are tender, cover kettle and boil very slowly.—B. O. R.

Personal Column



MRS. MORGAN'S CHOICE

Here is a quilt pattern I designed last night. I call it Mrs. Morgan's Choice and it looks fine if pieced of two colors. Mrs. Morgan.

—The original block Mrs. Morgan was kind enough to send me is pieced with the two colors, blue and white, and it is real pretty. I have several beautiful designs that have been sent in by my good readers and I will publish them from time to time. Be on the look-out for them.—Mrs. Annie Taylor.

Daughter Tries Recipe.—I write to thank you for the valuable information I received through your paper and readers. We all enjoy your paper and wish it was daily. My daughter 10 years old is the first one to the mail box Saturdays so she can read her parts first. She also tries some of the recipes and is learning cooking out of the M. B. F. and has wonderful luck especially with cakes and salads. She wishes me to send you a way to clean a screen milk strainer. Take a bar of hard soap and rub the corner of the bar on the screen. That forces the dirt through screen, then wash the screen in hot water to dissolve the soap. Enclosed please find $2.00 for five years subscription.—Mrs. C. J. R., Adrian, Michigan.

Cured Eczema.—I sure enjoy the paper and I look every issue for pretty apron patterns. I am one of the victims of eczema. I have been using the recipe that was in your paper some time ago—sulphur ointment rubbed in, wash the feet in 1 quart of water in which two tablespoons of epsom salts were dissolved—and I am glad to say my feet are cured. I told others about the salts for a foot wash and they said "it worked wonders." I am so glad to be free from eczema I must write and tell you about it. Thanking you for past favors, I remain as ever,—Mrs. J. A. B., Croswell, Mich.

Mistake in Salad Dressing Recipe.—In regard to the receipt for salad dressing I sent for the benefit of Mrs. J. E. S., of Manistee; I think she would be very much disappointed, if she tried it as the paper printed it. If you refer to my letter of a couple of weeks ago I think you will find about half of the receipe has been omitted. I am sending it again in case the first one has been mislaid.

2 eggs well beaten, 1 cup vinegar, 1 cup sugar, 1 teaspoon flour, butter size of walnut, ½ teaspoon salt, 1 teaspoon mustard. Set in hot water and cook. Cool before putting on cabbage or potatoes. Thin as needed with cream or milk.

Mistakes will happen with the best of people. Ever a friend,—Mrs. A. R. L., Elsie, Michigan.

—I am very sorry that only part of this recipe was printed because I know how you feel when you decide to make "something different" and you follow the printed recipe in every detail—and then find that it isn't a success. I will try hard to see that this never happens again.—Mrs. Annie Taylor.

Paint outdoor flower boxes white as it makes the most effective background for the green foliage and the bright flowers, and keeps their roots cool. All out-door things should be painted at regular intervals to off-set the forces of destruction—sun, wind, rain, sleet and hail.

—if you are well bred!

Little Points a Girl Should Take to Heart.—If a small brother shows himself a nuisance where men callers are concerned, by tactless remarks, cat-calls, and obtrusive lingering at tete-a-tetes or other manifestations inspired by the perverted sense of humor common to his years, remember than an entente cordiale is better than a state of open warfare. If you care to exercise tact and friendliness you can make a friend of little brother instead of a chronic tease.

Young men like to talk about themselves. If you wish to be popular with them, this is worth bearing in mind. Listening well will make you more sought after than talking well.

A girl should not be a coquette. Yet, within limits, she is not unjustified in encouraging the attention of several admirers. A girl whose company others find desirable, is more apt to be sought out by the one individual to whom her preferences may incline.

Many young girls are at a loss as to exactly when they should begin calling a young man with whom they are acquainted by his first name. This is something which should come of itself and cannot be established by rule. It is best, however, when acquaintanceship has ripened so as to make a "first name" footing natural, to let the young man take the first step in establishing it. If you then allow him to call you by your first name you could quite naturally call him by his.

Menu for July 5th

*Brown Fricassee of Chicken
Boiled Rice Baking Powder Biscuit
Apple and Celery Salad
Mince Pie
Coffee

***Brown Fricassee of Chicken.**—Draw, singe, and joint chicken. Put 4 tablespoons fat in saucepan; when brown, put in chicken. Stir until every piece is nicely browned, then add 2 tablespoons flour, stir again, add 1 pint boiling water or stock, stir until it boils; add 1 teaspoon of salt. Cover, and let simmer gently until tender, then add 1 teaspoon onion juice, and little black pepper. Put neckpiece, heart, liver, gizzard, and back pieces in center of dish; put 2 pieces of breast on top, second joints on one side of plate, legs crossed on other, and wing at each end of plate. Pour sauce over, sprinkle with chopped parsley, and serve.

RECIPES

Sardine Sandwiches.—2 tablespoonfuls melted fat, 1 dozen sardines, 1 tablespoonful whipped cream, 1 tomato, salt, pepper, and paprika to taste, lettuce leaves, slices of brown or white bread. Bone and skin the sardines, then rub through sieve, add cream, fat, pulp of tomato and seasonings and mix well. Spread mixture between slices of brown or white bread and butter, stamp out in rounds, in center of each round force a row of whipped cream seasoned with salt and red pepper, place small stamped out leaves of lettuce round the cream. Sufficient for twelve sandwiches.

Tomato and Horseradish Sandwiches.—1 tablespoonful fat, ¼ cupful grated horseradish, 1 tomato, bread, ¼ cupful mayonnaise, salt and paprika to taste, parsley. Mix fat, horseradish, and mayonnaise together. Skin and slice tomato, sprinkle with salt and paprika. Spread thin slices of bread and butter with fat mixture, and put sliced tomato between, cut into fancy shapes and garnish with parsley. Sufficient for ten sandwiches.

Pimiento Cheese Sandwiches.—2 tablespoonfuls fat, 1 cupful diced cheese, 1 teaspoonful cornstarch, 6 tablespoonfuls milk, 1 teaspoonful salt, 1 can pimientoes, paprika to taste, graham bread. Put cheese into double boiler, add fat, cornstarch, milk, salt, and paprika to taste and stir and cook until smooth, then add pimientoes cut into small pieces. Spread between buttered slices of graham bread. Sufficient for twenty-five sandwiches.

The Runner's Bible

(Copyright by Houghton Mifflin Co.)

The Lord will perfect that which concerneth me. Ps. 138:8.

There is a perpetual working of the Perfect Law of God. Whether one receives a blessing from it or not, depends largely upon one's appreciation and recognition.

The Spirit of Pioneering

Impatience with present facilities, a restless searching for perfect things—these have driven men to discovery and invention. They possessed the early voyagers who turned their backs on the security of home to test opportunity in an unknown land. They explain the march westward that resulted in this settled, united country. And they have inspired the activities of the Bell System since the invention of the telephone.

The history of the Bell System records impatience with anything less than the best known way of doing a job. It records a steady and continuous search to find an even better way. In every department of telephone activity improvement has been the goal—new methods of construction and operation, refinements in equipment, discoveries in science that might aid in advancing the telephone art. Always the road has been kept open for an unhampered and economic development of the telephone.

Increased capacity for service has been the result. Instead of rudimentary telephones connecting two rooms in 1876, to-day finds 15,000,000 telephones serving a whole people. Instead of speech through a partition, there is speech across a continent. Instead of a few subscribers who regarded the telephone as an uncertain toy, a nation recognizes it as a vital force in the business of living.

Thus has the Bell System set its own high standards of service. By to-day's striving it is still seeking to make possible the greater service of to-morrow.

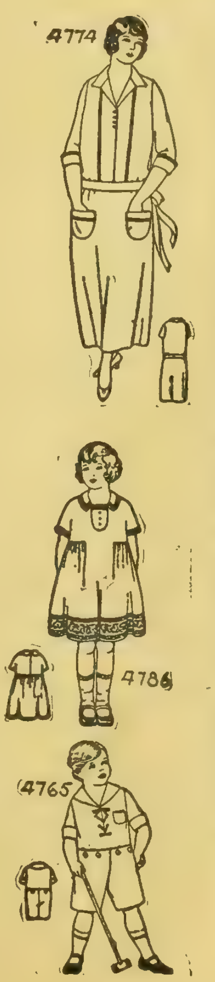
AIDS TO GOOD DRESSING

BE SURE AND SEND IN YOUR SIZE



4774. A Good Style for Mature Figures.—Linen, gingham, percale, jersey and crepe weaves are good for this model. The "vestee" is an attractive feature, it breaks the straight lines of the front, and is very becoming to stout figures. The sleeve may be in short "cap" length or finished with a cuff in elbow length. The Pattern is cut in 8 Sizes: 36, 38, 40, 42, 44, 46, 48 and 50 inches bust measure. A 38 inch size requires 5¼ yards of 27 inch material. The width at the foot is 1⅞ yard.

4786. A Pretty Frock for Mother's Girl.—Yellow linen with trimming of fancy wash braid or embroidery in colors will develop this model very attractively. The new alpacas and flannels are also good for this style. The Pattern is cut in 4 Sizes: 4, 6, 8 and 10 years. A 6 year size requires 2⅝ yards of 27 inch material.

4780. A Pleasing Model for a School Dress.—Checked gingham with bias binding and linene for collar and cuffs is here indicated. This style is also good for repp, chambrey, ratine and the new prints. The sleeve may be finished in wrist length, or in the short comfortable style shown in the larger view. The Pattern is cut in 4 Sizes: 6, 8, 10 and 12 years. A 10 year size requires 2¾ yards of 36 inch material. For collar and cuffs of contrasting material ⅝ yard is required.

4765. A Comfortable Suit for the "Little Man"—Freedom of movement and comfort is assured in a suit made like the model here portrayed. One may use linen, kindergarten cloth or seersucker. Or, have the blouse of Indian Head and the trousers of drill or chambrey. They may also be of pongee or flannel. The Pattern is cut in 4 Sizes: 2, 3, 4 and 5 years. A 4 year size requires 2⅝ yards of 32 inch material.

4787. Two "Nursery Toys."—The "Teddy Bear" has ever been popular with "little" children, and the Giraffe will please equally well. These toys may be made of felt, or flannel, or Terry cloth, and filled with cork, kopak, or excelsior. The "Teddy" may also be made of plush, "Terry bear cloth" or eiderdown. The Pattern is cut in One Size. It will require ⅝ yard of 36 inch material for the "Teddy" and ⅝ yard for the Giraffe.

4688-4789. A Practical Costume for Outdoor Sports.—Comprising Blouse Pattern 4688 and Knickers 4789. The Blouse is cut in 6 Sizes: 34, 36, 38, 40, 42, and 44 inches bust measure. The Knickers in 7 Sizes: 25, 27, 29, 31, 33, 35 and 37 inches waist measure with corresponding hip measure, 35, 37, 39, 41, 43, 45 and 47 inches. To make this Costume for a medium size requires 5⅛ yards of 32 inch material.

The Children's Hour

SOWING JOY

EVERY day we are sowing seeds—
They are good or evil deeds,
Growing greater every day
All long life's weary way,
Shining e're as rays of joy
Or as things which do annoy.

Let us e're sow golden deeds
And uproot all of life's weeds,
Let us plant the seeds of joy
And all evil plants destroy,
Let us make our lives worth while—
By wearing e're a friendly smile.

We can fill this world with joy—
If we would all harsh words destroy,
If we would live like flowers do—
Blooming all our lives through,
We could make this earth a Heaven
If we'd use the talents we are given.

But we will try our very best—
To pass every trying test,
And scatter e're the seeds of joy—
Uprooting all things which annoy,
Filling our lives with golden deeds—
Which grow forth from little seeds.
—Composed by Gladys Classman, R1, Sebewaing, Michigan. Age 16 years.

DEAR girls and boys:—Do you know any girls or boys who are referred to as "those foreigners"? No doubt you do, and I am wondering how you treat them. Do you accept them as playmates and try to teach them our ways and the ways of our country? Or do you avoid them and leave them to play alone while you and your friends play together?

If you went to live in a foreign land, where they talked a different language and their customs were different from those of this country, you would not want the people to turn against you, would you? You would not learn to like the people and their country if they did not help you to understand their ways and language, would you? You might but chances are against it. We should think of this when we meet children from a foreign land who have come to our country to make their home. If they are to live here we want them to love America the same as we do and it is largely up to us whether they become good citizens and good Americans. Treat them like a friend. Some people wonder why they continue to talk their own language after they are in this country a while. We must remember that our language is not their native tongue and it is hard for them to learn how to express themselves in English. I think that if we would be careful of our speech when talking to our sisters or brothers from other shores, speaking slow and distinct they would learn much faster. America is in too much of a hurry and does not take enough time to train her future citizens.

Girls and boys, let us all decide to help at least one foreign girl or boy become a good American within the next year. And if you will help more than one, so much the better.—UNCLE NED.

OUR GIRLS AND BOYS

Dear Uncle Ned:—Here I am again with a poem which I hope you will see fit to print. I sent a poem about 'Spring' to you about the fist of May and was glad to see it in print. I wrote a poem about 'Sowing Joy' for the M. B. F. but I lost it so to-day I wrote the one I am now sending. I will close with love. As ever your loving niece,—Gladys Classman, R1, Sebewaing, Michigan.

Dear Uncle Ned:—We have been taking your paper and I always like to read it. The first thing I look for is the boys' and girls' page. I have never written to you before, so I thought I would write a few lines to. I will describe myself. I am 13 years old, have blonde hair and light blue eyes, am light complexioned, and five feet and three inches tall and weigh one hundred and five pounds. I am in the 6th grade at school. I live on a farm of 170 acres of land. We have 17 head of cattle, 4 horses and 100 chickens and 4 pigs. I have two brothers and five sisters. My mother is away. Uncle Ned is it the style to have your hair bobbed or have it grow out? I never see any letters from Summit City. The weather is very warm up here. We had a little storm but it went away. I wish some of the boys and girls would write to me. I would be very glad to answer all the letters that I get. I will have to close before Mr. Waste Basket get this letter. Good bye Uncle Ned. Your Want-to-be niece,—Valeria Rodes, R. 1, Box 42, Summit City, Mich.

—I would say the style is to have the hair bobbed. It seems you seldom see a girl with long hair any more.

Dear Uncle Ned:—I am a lonesome boy who wants to join your merry circle of cousins. Well I guess I had better describe myself. I am 5 foot 7 inches tall, weigh 143 pounds, blue eyes, black hair and my age is between 15 and 20. The girl that guesses it right will receive a real box of—well Uncle Ned I won't tell what is in that box. Well I must close or Mr. Waste Basket will receive my letter. From your want-to-be nephew,—Billy Frank, Box 87, Alabaster, Mich.

Dear Uncle Ned:—I have been a silent reader of the M. B. F. for a long time so thought I would write. I hope this letter does not reach the waste basket. My, it seems as though it would never be summer doesn't it? If it doesn't warm up pretty soon we will have to pack our trunks and go to Florida. Ha! Ha! We found a few wild strawberries. There are lots of green ones. We have quite a patch and expect to get quite a few strawberries. We set out the patch last year. We have our garden planted and it is up now. We have to weed it. Do you like to weed garden? Well I guess I had better describe myself. I am a girl 11 years old. I have blue eyes, brown hair (bobbed), and 4 feet 8 inches tall. I weigh about 84¼ pounds, am in the 7th grade at school. I haven't heard whether I passed or not. I will close hoping some of the boys and girls will write to me. I will answer all letters. Yours with best wishes,—Doris McBride, Hopkins, Michigan, R1.

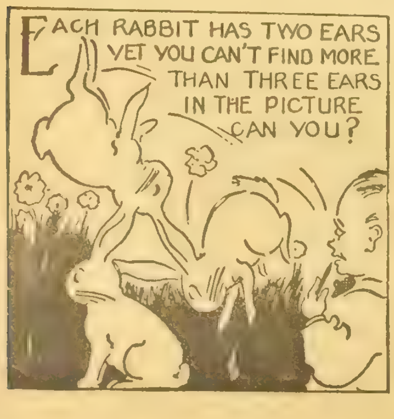
Dear Uncle Ned:—I think Mr. Waste Basket must be pretty fat by now. He has gobbled up two of my letters to say nothing of all the others. I hope he doesn't eat this one as it might be interesting to some of the boys and girls who have never seen a fish hatchery. Mrs. Frasher, our teacher, invited the scholars to go home with her at different times, of course. Reva, a schoolmate of mine, and myself went home with her for the week end. On Sunday we went to Paris to see the fish hatchery. It certainly is fine. The pond is separated into different parts. The large fish in one part and the smaller ones in another part, and so on. The fish are very pretty. Some of them are blue, and some are green. I saw one that was yellow. They are all spotted with black. After we had looked at the fish in the pond we went into the building which is quite large. There are large tanks inside with fish in them. A few of them are quite good sized, but mostly they are tiny fish and the eggs. In some of the tanks there are tiny fish in the eggs with just their heads and tails out. Then there are places where the fish are entirely out of the eggs. It is all very interesting. I guess that is all there is to write about that. You say you would like to know what I look like? There really isn't much to. I am five feet five inches tall and weigh one hundred and seven pounds. I have dark red, bobbed hair, blue eyes and a fair complexion. I am fourteen years old, and I will be in the seventh grade next year. I walk a mile and a half to school. Hoping some of the cousins will write to me, I will bid farewell to Uncle Ned and Cousins.—Miss Avis Smith, R2, Blanchard, Michigan.

Dear Uncle Ned:—I have been a silent reader of the M. B. F. for over three years and enjoy the reading very much. I thought I would write and see if I could join the Merry Circle. Hold on! I better describe myself. I have black hair, light blue eyes, rosy cheeks, am 5 feet 7 inches tall and am 14 years old. I live on a 40 acre farm 4 miles from Lake Huron. We have a pair of twin lambs, we took their pictures the other day. For pets I have 3 cats and 1 dog. I went to school every day and our school is out now. I am in the 8th grade. I like school just fine. Will have to excuse poor writing this time for this is the first time I ever had my name in print, so I am excited. I like to go to church and Sunday school. I can memorize every book in the bible. I have lots of friends to play with and there are lots of children living around here. My girl friend's name is Mary B. I will close with a riddle for the boys and girls to guess: Round as a apple, round as a biscuit, busy as a bee, the prettiest little thing you ever did see. The one that thinks they know this riddle write to me and I will see if you got the answer right. —Mable Toly, Carsonville, Mich., R4.

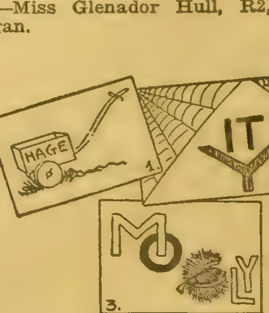
Dear Uncle Ned:—I have been reading the M. B. F. for some time and sure enjoy reading it. Well I will describe myself. I have black hair which of course is bobbed and have fair complexion and rosey cheeks. I am "sweet 16" and my brithday is in October. Do you like bobbed hair? I was to a dance Tuesday and sure had a nice time. I certainly like to dance. I go to a dance twice a week. There was a dance here at our place last Saturday night and there sure was a big crowd. I am planning on going to Detroit in July. I never was out there yet and am very anxious to go and see what kind of a city it is. I often think I will miss the dances around here, also my good friends. I got a letter from my sister in Detroit the other day and I was telling her in the letter I wrote about all the dances there are around here and she said I should not mention them because it makes her lonesome and blue. Well I think my letter is rather long so will close with hopes of receiving some letters from some of the cousins.—Mabel Monette, Cathro, Michigan.

Dear Uncle Ned:—This is not the first time I have written you. I have written three or four times before but did not see them in print so I will try again. I am in the sixth grade. My age is between seven and eighteen. The one that guesses my age correctly will receive a card and a long letter from me. My first name is Mildred. How many children are there Uncle Ned that are named that name? I am sending some riddles: Little Miss Ettycoat, in a white petticoat, the longer she stands the shorter she grows. Ans.—Candle. There is a little white house and full of meat but no door to get into eat. Ans.—Egg. What's the difference between a hill and a pill? Ans.—One's hard to get up and the other's hard to get down. This is all for now.—Mildred Lindhurst, R. 2, Ceresco, Michigan.

Dear Uncle Ned:—May I join your merry circle. I live on an 87½ acre farm three and one half miles from Berry. My father has taken the M. B. F. for three years. I enjoy very much reading the Children's Hour. I am 5 feet 2 inches tall, I have dark red hair and hazel colored eyes. I am thirteen years old and my birthday is December 8th. I have two sisters. Mary is seventeen and Jean is almost three. I go three and one half miles to school. Hoping to get a lot of correspondence. As ever your niece,—Miss Glenador Hull, R2, Perry, Michigan.



EACH RABBIT HAS TWO EARS
YET YOU CAN'T FIND MORE
THAN THREE EARS
IN THE PICTURE
CAN YOU?



Each picture represents the name of a city in Missouri. What are the three cities?

Answer to last puzzle: The objects are: LA, SAW, SI. NINE, LEG, BOARD and BONES. The names of the stars are: GLORIA SWANSON and BEBE DANIELS.

Surprises At the Dog Parade

CARTER gave a sharp whistle to to awaken "Ruffy" who was asleep on the front porch. The dog looked up out of one eye, then seeing his young master sprang to his feet and trotted down the walk to where Carter stood. "Come on, old boy, we've got to beat it. The parade begins at ten sharp."

Ruffy seemed to understand and he ran down the street in an excited manner, his long yellow hair shining in the sunlight.

Carter could not take the dog on the street car, so they started on their three-mile walk to the heart of the city where, in the large auditorium, all the boys and girls and their dogs were to assemble before the great event of the summer—the dog parade. Many prizes were to be awarded at the termination of the procession.

Each child in his own heart knew that his dog would be a prize winner.

Carter was proud of Ruffy, a beautiful, yellowish-brown collie, with great, big brown eyes that looked up into his little master's face with admiration every few steps.

As they approached the auditorium Carter saw a steady stream of children and dogs coming from all directions. Some of the dogs were led by a leash, some small ones were carried, others rode in wagons and one small white fluffy spitz rode in state, in a baby carriage.

Before Carter entered the big building, where all the dogs could be heard barking and yelping at each other, he put on Ruffy's leash so he could hold him. Ruffy might get into a fight, if not held tight. The children struggled to keep the animals from pitching into each other. One fight was called off between a Scotch terrier and a Boston bull terrier, when it looked as if the two hundred dogs were all going to join in.

The band struck into a march, men called, and the line of procession began to form. First came a St. Bernard led by a small girl; then came the tiniest dog, a Mexican hairless; then a wonderful white Russian wolfhound; a bull dog with a pipe in his mouth and glasses on his nose came next; following him came Airdales, Irish setters, and representatives of all the different terrier families. All the leading breeds were in the parade. Some of the dogs liked it, others would not keep in line and made wild dashes to get away.

Then came Carter's turn. He was ready to start, his face shining with joy, until a woman passed him who shouted, "Oh, that's Rex, my dog!"

Ruffy heard her voice and gave one bound toward her.

Carter stood by, declaring, "He's mine. He's mine, and I paid for his license with all my own money."

Carter's place was filled in the line while he tried to claim Ruffy's ownership.

The lady said that Rex had been lost for two months. The dog seemed bewildered. First he jumped all over the lady, then over Carter who, finding the dog knew the woman, exclaimed, "He came to my house two months ago and whinned to get in, one cold morning. We tried to make him go away, but he would not go. We looked in the ads for a lost dog, but not any were found about Ruffy. So I fed him and I guess he loved us, 'cause he stayed." Carter leaned over and patted the dog, then threw his arms around his neck and buried his face in the mass of Ruffy's long yellow hair. When he looked up there were tears in his eyes and his voice trembled. "Take him away, quick, if he's yours."

The lady felt badly and offered Carter some money for being kind to her dog, but the lad refused it. "No, no, please, I can't take it."

Manfully Carter and Ruffy parted, and the tears running down each cheek. He dashed them away before he thought any one would notice him. But—a man had watched the parting of the boy and dog. The parade was going down the street.

Some one touched Carter. "Hello, son, you are the boy I'm looking for! Will you take this dog in the parade for me? You seem to have lost your dog. His name is "Max." Hold on to him tight, he is pretty lively."

Before Carter could speak he had been given the leash and pushed into position in the parade. He looked down at the dog; he smiled; he was in it after all. The band played, the people shouted, and the dogs yelped as they walked through the crowded streets. Then, at last, the two hundred children and their pets came back to the auditorium and passed before the judges' stand. Here the prizes were to be awarded.

Five dollars went for the best bred dog. Then two dollars for the largest dog, the smallest, the best behaved. The same amount was given to the best cared for dog, and Carter felt a pang grip his heart as Ruffy was given that prize.

Many more prizes were called. Carter started looking for the man whose dog he had. Soon he saw him standing in the judges' stand. The man stood up and made an announcement. "Boys and girls, the big prize of the day is now to be given away. It is the thoroughbred Airdale, Max. He goes to the most deserving boy, Carter Robinson."

So Carter went home, in the gentleman's car, the proud possessor of Max, who from the very start loved his new master.

Could Our Tax Totals Be Held Down By Law?

(Continued from Page 3)

to back them, legislators could discharge much more easily the never-ending procession of individuals, committees and delegations who besiege the state capitol in quest of appropriations.

"When property taxes are limited the legislature may choose between two courses. It may hold expenditures to the revenues placed at its disposal or it may draw revenues from other sources.

"With the rapid growth of Michigan and the persistent public demand for more and better governmental service, the inevitable increase in the cost of government must be apparent to all. It is by anticipating increased expenditures that tax limitation promises its greatest service. After expenditures have undergone the pruning that would naturally follow controlled revenues, the legislature would be faced with the task of producing funds from other sources. Classes of taxpayers now carrying less than a fair share of the cost of government would be asked to assume an increased load. Some classes of the property now paying nothing would be asked to assist. Real estate's load would remain practically stationary. New revenues would be spent in lieu of rather than in addition to taxes from real estate.

"The operation by which the proportion borne by real estate would be reduced, probably is apparent already. As total taxes go up and up, real estate's share (the amount remaining stationary) would become proportionately smaller and smaller. The percentage of real estate taxes to total taxes would drop from 79½ per cent to 70 per cent, 65 per cent and thus on down until it reached a proper ratio. When the line representing real estate taxes dropped to the line representing real estate wealth (as it would eventually under the limitation plan) real estate would again step into the ranks with other taxpayers. She has no desire to escape her fair responsibility to government.

Has High Approval

"The Michigan Real Estate Association's plan for tax limitation is not a lately-conceived tax cure-all. The plan was advanced by the association two years ago and presented to the legislature of 1923. It passed the house by a handsome vote and came within two votes of passage in the senate. It has been submitted to the searching scrutiny of economists, tax students, editorial writers and legislators of several states. Not one weakness in the plan has been pointed out. Not one intelligent argument against it has been advanced. In contrast, it has been complimented from scores of sources. Many believe that within the plan is to be found a suggestion that would clarify discussions that have perplexed many legislatures.

"The Michigan Real Estate Association does not say that approval of the constitutional amendment it seeks would solve the problems of real estate taxation. It recognized that there still would remain the problems of city, school and county taxes and that these vastly overstate taxes. But the legislature and state officers are concerned particularly with state taxes and it is to them that the Michigan Real Estate Association will present its conclusions next January.

"The fact that no weakness in the plan has been revealed cannot be accepted as proof that none exists. The Michigan Real Estate Association is interested in results rather than methods and holds an eager ear for the one who can improve upon its plan or offer a better one. The organization is not bigoted.

"Let there be searching analysis of the plan advanced but let those who participate proceed fairly. The Michigan Real Estate Association will have small patience with the person either in public or private life, who, inspired by insincere motives, undertakes to divert attention from an action that threatens to disturb the blissful repose of some class of property that now enjoys tax benevolence, or in fact, tax immunity."

How About It, Folks?

Such, then, are the arguments advanced by the Michigan Real Estate Association and we are glad to present them herewith for the thoughtful consideration of the readers of THE BUSINESS FARMER. It is time that we thought and thought hard about this extremely vital question of tax reduction and readjustment. It may well be said without exaggeration that there is no more important and timely question before our citizenship today. It cannot be over emphasized.

The insiduous ramifications of the baneful effects of high taxation are forcefully pointed out by Professor Clyde J. Crobaugh of Indiana University in the leading article in the Kiwanis Magazine for June of this year. Professor Crobaugh concludes his plea for tax reduction as follows:

"It has been demonstrated by experience that high taxes interfere with the normal course of business, divert capital into unprofitable channels, and put a brake on initiative and a damper on enterprise. Excessive taxes also compel a curtailment of consumption and lower the standard of living. Tax reduction will benefit all interests. The farmer will be greatly benefitted by lower taxes. Reduced taxes will help business by decreasing the cost of production. Tax reduction will even aid the government by removing the temptation to prodigality, waste, extravagance and corruption. The consumer will be benefitted by lower taxes through a decrease in the cost of living.

"Can there be a reasonable expectation for tax reduction in the near future? This question is no doubt upon the lips of millions. The answer depends upon the people themselves. The taxpayers must be interested in their own affairs, for tax reduction is the people's business."

M. A. C. WILL EXHIBIT SEPTIC TANK AND DISPOSAL SYSTEM

DURING August, September and October the M. A. C. will send a demonstration train through the southern four tiers of counties in the state demonstrating a septic tank and water disposal system for the farm home and outlying buildings. Mr. O. E. Robey, extension specialist of the Agricultural Engineering department, will have charge of the train.

The new system, which is said to make possible efficient, cheap and sanitary sewage disposal, besides safe-guarding the water supply from contamination, has been perfected by Mr. Robey and Prof. H. H. Musselman, head of the M. A. C. Agricultural Engineering department, and is the outgrowth of the experience gained through the construction of nearly 100 systems and from observations on the operation of many of these systems under various conditions, extending over a period of eight years.

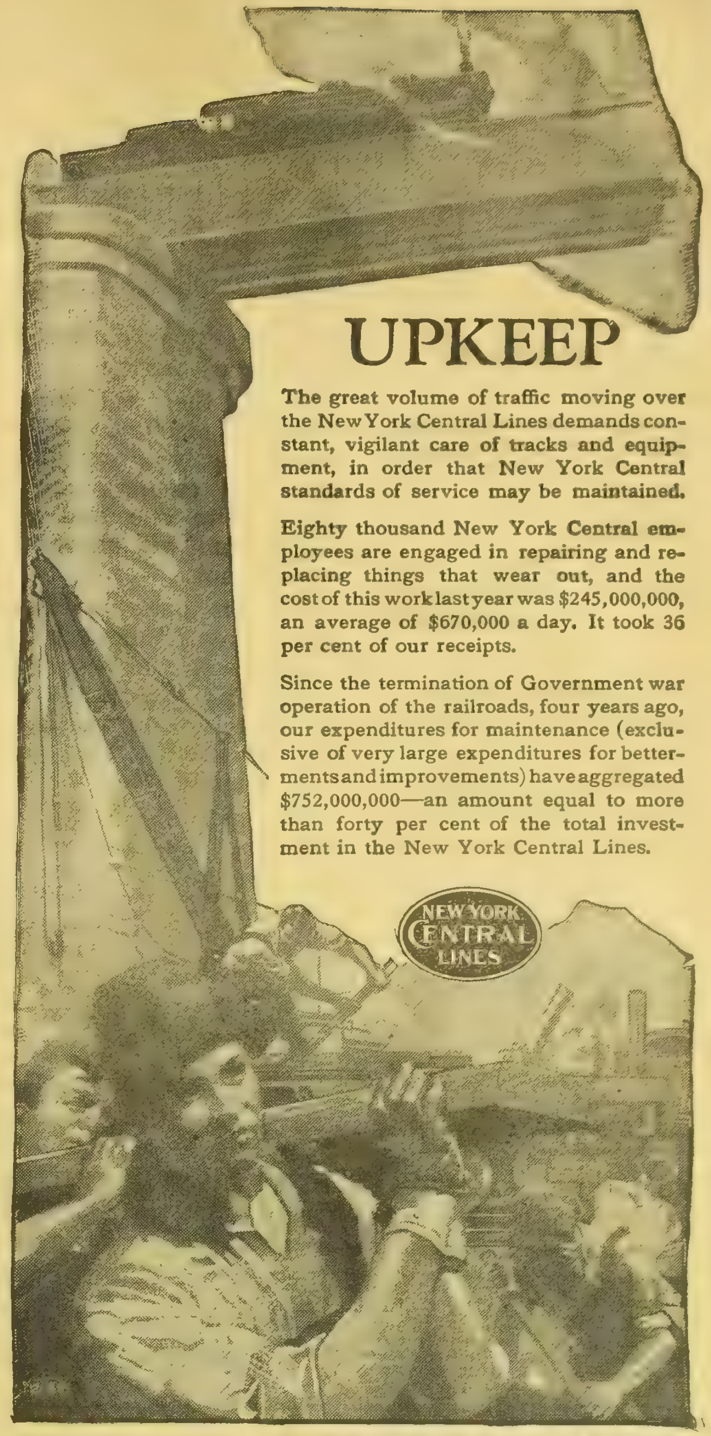
The demonstration train will travel by truck, giving two demonstrations each day and devoting two days to each county. A complete septic tank will be constructed and demonstrated at each stop.

CLUB LEADERS HOLD SUCCESSFUL MEETING

SIXTY county boys' and girls' club agents and leaders attended the meetings of the ninth annual training school and club leaders' conference which was held at Michigan Agricultural College from June 17-20, according to R. A. Turner, state leaders of boys' and girls' club work. The visitors were addressed during the conference by acting-president R. S. Shaw, R. J. Baldwin, director of extension work, Mrs. L. H. Campbell, state leader of home demonstration work, R. A. Turner, and a number of M. A. C. department heads and club leaders.

M. A. C. INSTITUTES NEW POULTRY SCHOOL

THE first formal school in poultry judging, breeding and management to be offered by a Michigan educational institution commenced at Michigan Agricultural College on Monday, June 30, ends on Saturday, July 5. The course is designed to prepare those who satisfactorily complete the work to become poultry cullers on a commercial basis, in response to a widespread demand from Michigan farmers, according to Prof. E. C. Foreman.



UPKEEP

The great volume of traffic moving over the New York Central Lines demands constant, vigilant care of tracks and equipment, in order that New York Central standards of service may be maintained.

Eighty thousand New York Central employees are engaged in repairing and replacing things that wear out, and the cost of this work last year was $245,000,000, an average of $670,000 a day. It took 36 per cent of our receipts.

Since the termination of Government war operation of the railroads, four years ago, our expenditures for maintenance (exclusive of very large expenditures for betterments and improvements) have aggregated $752,000,000—an amount equal to more than forty per cent of the total investment in the New York Central Lines.

CHICKS of QUALITY

Bred from Sires of 250 to 280 Egg Strains

BIG BARGAINS for June and July

Prices now within the reach of everybody. Get chicks in June and July and gather your harvest next winter. This is the most **economical** time to buy and the most favorable time to raise chicks. You can get them in the big outdoors at once which saves labor, **cuts down your feed bill** and makes the chicks **grow twice as fast.** Bright, balmy days bring splendid development. Our **June** chicks will begin to lay in **October** and **July** chicks in **November.** The **BIG SAVING** in price gives you an opportunity that you cannot afford to let pass by.

Chicks that are **strong, peppy,** from high production, egg bred stock are the chicks that **pay.** We have **sacrificed on price** but the same standard of supreme **quality** is always maintained regardless of price. Our breeders are producing heavily, our incubators working to full capacity and this enables us to give these high grade chicks at such **extremely low prices.**

EXTRA SPECIAL FOR JUNE AND JULY

Varieties	25	50	100	500	1000
Extra Selected Barron or Hollywood S. C. White Leghorns sired by 250 to 280 egg males	$2.75	$5.25	$10.00	$45.00	$ 90.00
Selected Barron White Leghorns	2.50	4.75	9.00	42.50	80.00
Extra Selected Sheppare Mottled Anconas	3.00	5.75	11.00	52.50	100.00
Selected Mottled Anconas	2.50	4.75	9.00	42.50	80.00
Selected Park's Bred-to-Lay Barred Rocks	3.75	7.00	13.00	62.50	120.00
Broiler, Mixed Chicks	Seven cents straight.				

PULLETS AND BREEDING STOCK FOR SALE

After June 1st we offer Selected White Leghorn Pullets, 8 to 10 weeks old at $1.10 each; Sheppard Ancona Pullets at $1.30 each and Barred Rock pullets at $1.50. Prices reduced for 100 or more.

After July 15th we have **700** choice **Tom Barron** and **400 Sheppard Ancona** breeding hens for disposal at **$1.25 each.** Also, selected cocks of same breeds for **$1.25 each.** These must be sold to make room for our growing stock. Our space is limited.

ORDER AT ONCE from this ad. We can make immediate shipment. Cash with order or sent C. O. D. if desired. All chicks sent to your door by parcel post prepaid. 100% alive delivery guaranteed. Pullets and stock shipped by express, charges collect. Catalog free.

DAIRY and LIVESTOCK

MICHIGAN GETS CHOICE WISCONSIN HOLSTEINS

SEVEN Michigan Holstein breeders increased their herds with 16 purebred Holsteins purchased at the dipersal sale of the John Erickson herd at Waupaca, Wisconsin, recently. This herd was recognized as the leading Holstein breeding establishment in the United States and the average selling price of $1,138 for each of the 84 animals sold, over one-third of which were less than two years of age, is the highest average attained at Holstein auction sales in recent years. Cattle were sold to buyers from Japan, South America, Canada and 15 states.

Those of Michigan listed among the purchasers and the number of cattle bought by each are: Detroit Creamery Company, Detroit, seven; James P. Jones, Detroit, three; Mrs. Horace Dodge, Detroit, two; and John E. Lambert, Detroit; G. A. Casagranda, Iron River; Martin D. Buth, Comstock Park, and Wm. Tyson, Washington, one each.

FARMERS' CATTLE JUDGING CONTESTS

A CONTINUOUS cattle judging program for farmers from every state is being arranged for the National Dairy Exposition at Milwaukee, September 27th to October 4th. Coupled with the contest will be dairy cattle demonstrations by national expert judges of cattle. These two features will afford a liberal education to every man who is a buyer of dairy cattle and wishes to be informed on how to select good ones.

Prizes are to be offered at farmers' Judging Contests at county fairs and farmers' picnics in dairy states. Winners at these contests will attend the National Dairy Exposition and throw their hats in the ring. If they do not win they can step to the side lines and listen to the experts explaining the points that are judged in the rings where the ribbons are tied on the cattle and not on the men. The National Dairy Association is offering special prizes to the winners of the contest. The leaders for dairy development at the agricultural colleges in each of the states is working out plans for participation in these contests by farmers from their state.

Another attraction for farmers will be the exhibit of grade cows from Cow Test Associations, all to go on the auction block during the week of the Show. These cows will all be exhibited in the regular classes of the Show and judged by the regular judges of the Show, their sanitary certificates entitling them to enter any state and their record of production certificates officially signed will be attached to the cows.

These contests and exhibits give a fellow a life time lesson of great value and are only a part of the plans to make this year's National Dairy Show a farmers' Show.

CHICAGO ASSOCIATION OF COMMERCE OFFERS SCHOLARSHIPS

AGRICULTURAL college scholarships will be awarded to the three contestants making the highest scores in the non-collegiate live stock judging competition to be held in Chicago, November 28th, during the silver jubilee celebration of the International Live Stock Exposition according to an announcement of the Chicago Association of Commerce.

These scholarships, totaling $1,000 will be known as the Chicago Association of Commerce scholarships and constitute a part of its campaign for the betterment of agricultural conditions. Competitions at Chicago is limited to one team of three juniors from each state. Preliminary contests to select the state representatives are held in communities and counties and the preliminary winners are brought together at the State Fair or Agricultural College to determine the State Championship team.

FEEDING VALUE OF SWEET OR SOUR MILK

I would like to know through the columns of your paper which is the best feed for pigs, sweet or sour milk.—J. S., Pinconning, Mich.

EXPERIMENTS have shown that there is no difference in feeding value between sweet and sour milk. So far as experiments have been conducted at this station, it has been found that where skim milk has been fed after the foam has settled off or been removed in comparison with skim milk soured by the use of a pure lactic acid culture, that there was no difference in feeding value. Sour milk which is allowed to stand around in dirty receptacles often has other organisms aside from the lactic organisms working and may prove very detrimental.—Geo. A. Brown, Professor of Animal Husbandry, M. A. C.

Lucky Farmers At Rives Junction, Michigan

THEY say that farmers won't get together, that they won't stick! That farmers co-operative enterprises fizzle out! Et cetera!

Some truth in these claims, all right, so it is refreshing to discover a bunch of farmers that did get together and are still glued.

They also—they that know the farming game from the calloused hand, sweaty-shirt angle—claim that lady luck seldom tries to vamp a farmer.

Nothing erroneous about the statement either. Again, then, is interest aroused to discover that luck—"Bull" luck—recently smiled upon this aforementioned co-operating bunch of farmers.

The Bunch, alias The Rives Bull Association. Meet them, off of Rives Junction, Michigan: A. H. Perrine, Pres., cows pledged, 15 purebreds; Ben L. Smith, vice-pres., cows pledged, 10 purebreds; L. F. Foster, sec.-treas., cows pledged, 12 (1 purebred); Will Perrine, member, cows pledged, 8 (2 purebreds); Burt Phelps, member, cows pledged, 12 grades; C. J. Cochran, member, cows pledged, 5 (3 purebreds); Lee H. Foster, member, cows pledged, 10 (1 purebred); Burt Blair, member, cows pledged, 10 (1 purebred); Clare Darling, member, cows pledged, 15 (8 purebreds); Total 97 (31 purebreds).

What did they do? Got together amongst themselves and decided that what they needed most as dairymen and breeders of Holstein cattle was a Real Bull. They figured that collectively they could buy a better bull than any one of them could afford to buy all by his lonesome. They allowed that using an extra high class sire would mean more profitable cows to milk after while, would mean that their surplus stock either pure-breds or grades would sell to better advantage if sired by or in calf to a far-better-than-ordinary-bull.

In completing their organization in January, 1923, these men were assisted by the County Agent of Jackson County, R. E. Decker, and by S. J. Brownell, then with the Dairy Department of the Dairy Department of the M. A. C. and the Michigan State Holstein Ass'n., also gave a boost or two toward the last.

King Sylvia Ferndale Aaggie 387538—that's the name of the bull the bunch finally purchased. He was born November 14, 1921. They paid a good sum for him, too, but it did not come so hard on any one member because each paid his share in proportion to the number of cows he expected to breed to the bull.

As to breeding, just "lookit" what they bot: Sire: Echo Sylvia King Model The senior herd sire of the Traverse City State Hospital. Dam: 3 records above 33 lbs., the highest 36.13 lbs. Her dam a twice 37 lb. cow. Dam: Rubertdale Flint Ferndale Aaggie, 32.37 lbs. butter, 561.1 lbs. milk Dam: 31.05 lbs. butter, 487.9 lbs. milk.

Now this bull had to have a home, so the bunch provided him with a couple of them. He sojourns with A. H. Perrine for three weeks and is then ambled over to the L. F.

Foster farm for a like stay. The rest of the bunch chip in in proportion to the cows they breed to pay these home-makers for the expense of care and feed.

Sixteen months have rolled around and all is well with the Rives Bull Ass'n. Bull looking better every month, stuff getting safe in calf to him, calves starting to come, straight, stylish rascals, members agreeing O. K. All lovely and then:

Here comes the luck!

Let the trumpets sound and the Bull Fiddle whang!

C. S. Heeg' Sons of Howell, Michigan, who sold the bull to the Rives bunch re-tested the dam, Rubertdale Flint Ferndale Aaggie, and made 36.18 lbs. butter from 631.3 lbs. milk!

The Rives bull now has an average 7 day production for his three nearest dams of 34.45 pounds butter. What breeder in Michigan has a sire boasting of better than that? And don't forget that the sire of the Rives Bull, Echo Sylvia King Model, the Senior Herd Sire at the Traverse City State Hospital, has for average production of his three nearest dams 38.16 lbs. butter in a week. He has eighty daughters in the herd, forty-two of them A. R. O. records, the highest daughter with over 32 lbs. as a Junior three-year old!

So, if any bull in active service in Michigan beats the Rives bull for 7-day average of his three nearest dams it is his own sire!

The boys at Rives are sure happy at this good fortune. But they are not leaving the future all to luck, no indeed. They are asking the milk-scales, the Babcock test, their bookkeeper to decide whether their cows are fit to mate with so good a sire. For over half the bunch are members of a cow testing association. In fact, Arthur Perrine, L. F. Foster & Son, Ben Smith and Lee Foster are working in their fourth consecutive C. T. A. year!

When the daughters of the famous bull come into milk they will undoubtedly have to prove by C. T. A. methods whether they are better, more economical producers than were their dams.

Surely farmers who have sufficient interest in their business to belong to a C. T. A., who have enough initiative to get together to buy a fine sire, who have the right amount of real neighborliness so that they hang together, surely these men deserved this fine piece of luck.

We all congratulate them.—J. G. Hays, Dairy Department, M. A. C.

VETERINARY DEPARTMENT

LUMP JAW

I have a two year old heifer that has a lump on her left jaw, about the size of a billard ball. When I cut it open quite a quantity of pus comes out. That was a week ago. On opening it the second time there is not pus but the swelling remains. Could you tell me what it is and what can be done to cure it. It first appeared two weeks ago. Some of my neighbors say it is lump-jaw. If this is true is it contagious?—M. L., Turner, Mich.

THE heifer in all probability has lump jaw. The swelling might, however, be a simple abscess. If an abscess and it is opened and drained, it will generally bring about a cure. Some cases of lump jaw can be successfully treated by the internal administration of potassium iodide. Better consult your local veterinarian about the treatment of this case. If it is lump jaw, he can supply you with the iodin together with the directions how to use it.—John P. Hutton, Assoc. Prof. of Surgery and Medicine, M. A. C.

BIGGEST HORTICULTURAL TOUR WILL COVER 17 STATES

FOR years, the Horticultural Societies of the different States in arranging the dates for their summer meetings have consulted their own convenience and have not given a thought to the fact that there are many horticulturists and orchardists in other States who would probably attend, if meeting dates did not conflict.

This summer the American Pomological Society has arranged for cooperation of 17 States that have arranged their meetings two or three days apart so there will be no conflicting dates and so one State meeting follows another. The American Pomological Society will cooperate in the program in each State and an official American Pomological Society speakers' car will go from State to State, thus giving the orchardists of each State an opportunity to hear some of the leading horticultural authorities of the United States. The speakers will go in relays, each speaker being on the program in several States—much like the large chautauqua circuits are arranged.

In the following list where the name of the State is given, it indicates that the State Horticultural Society meeting (of that particular State) will be held on dates printed before name of State. Where the word "touring" is opposite dates, it indicates time going from one State to another. Although no special itinerary on these "touring" dates can be lined up now, opportunity will be given to visit any interesting orchards that happen to be on the line of travel from State to State.

July	14-15	Kentucky.
July	15-16	Indiana.

Aug.	14	Mass. (Eastern)
Aug.	15-16	Maine.
Aug.	17	touring.
Aug.	18-19	New Hampshire.
Aug.	20	touring.
Aug.	21	Vermont.
Aug.	22-23	Mass. (Western)
Aug.	24	touring.

The line of tour his been arranged so that there will be the shortest jumps possible from State to State. Furthermore, the general direction of the route has been arranged so that most of our tour will be on hard surface roads where road conditions will cause the least possible amount of trouble. All details of the program, etc. to be under supervision of the State Horticultural Society of each individual State.

All orchardists should endeaver to attend their own state tour and meeting—also tour in as many other States as possible. This is a united effort to better the orchardists' condition and everyone should get behind the movement and boost to make it a splendid success.

THE ONE HUNDRED TENTH PSALM

(Continued from page 11.)

they marvelled while he tarried in the temple." There are those today who are wondering why our High Priest remains so long in his temple. But, listen! While he is there, the church is to keep up its fight against sin. The master is praying that our faith fail not. How long? Until we rule over our enemies in His Name. Until every man and woman has heard the call to mobilization. Then the Priesthood ends, and Jesus comes out of the temple to sit on the throne of his glory, "and before him shall be gathered all the nations," Matthew 25:31, 32. He that is willing shall inherit the new earth, but he that is unwilling shall be left in the way that perishes.

The battle seems hard and long, but our Leader is interceding with a God that "hath sworn victory" and will not repent. This is the surety that is given to the church. And since we are on the way to to that glorious day, let no one die the death of a neutral or conscript.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

CHICK COMFORT IN HOT WEATHER

THE comfort of the chicks during the hot days that are here has a great influence in determining the extent of their growth and egg production during the coming fall and winter. Eggs in any appreciable quantity cannot be expected along other seasons except from strong healthy hens, full of vigor and vitality. The best way to conserve the vitality and build up the bodily strength is by keeping the birds comfortable, by providing for their real needs.

Chickens that are constantly exposed to the direct rays of the hot sun will be stunted and greatly weakened in vitality. Plenty of cool refreshing shade is necessary if the chicks are to develop in a normal manner. There is nothing more injurious to the growing flock than to compel them to remain out of doors in the sun during the heat of the day, exposed continuously to the burning rays of the summer sun. Natural shades are by far the best, but where such cannot be grown, then artificial shades should be arranged.

Muslin or burlap covered frames set at an angle so the birds will not roost on them are good. A shelter of leaky boughs elevated on crotched sticks about two feet above the ground are very satisfactory. The shade, however, given off by a green plant seems to be much cooler and more refreshing. This is doubtless due to the large amount of moisture which is constantly being given off by the leaves of such plants. Thousands of growing chicks are annually lost because of wrong methods and mistakes of shelterings and feeding. It behooves us to use methods which insure the lowest loss, most economical and quickest growth. There should be continuous growth, uniform growth, profitable growth and still more growth. These are the aims when caring for the chicks, cockerels and pullets during the summer on the range. I find that it is just as necessary to give care during growth as it is at earlier stages of chick life. In fact, care and careful management are required at all stages if you are to succeed. There is one need of our chicks that too often neglected, and that is their supply of fresh water, in clean vessels.

Fresh, Clean Water

The first thing that little chicks want, or older ones as to that, every morning, is a fresh drink of water, a need that should receive our special attention during the hot summer days. Chicks need lots of water and should have it, if we would find the season a profitable one at its close. It is very essential that pure water be kept before the flock at all times. One of the worst things to do is to neglect to water at a proper time, and then compel the chickens to get all the water for several hours at, perhaps, the close of the day. A chick should always know where the water is and be able to get it at all hours, and if it is not provided it will suffer greatly for want of it. There is no use watering chicks one day and forgetting the next. There is nothing exhileratiing or exciting about it but the "chore" of carrying water, of cleaning the water basin, of spraying the coops, are the things which will benefit the birds. Water goes to make up a large portion of the bird's weight.

During the summer, when the extremely hot weather comes, we should see that they have plenty of cool room and fresh air. Chicks must be watched that they do not crowd one another into corners, for smothering will surely follow as a natural result. Too many bunching together during the night is very injurious, and getting out in the cool morning get chilled and contract cold and roup. This often causes sorehead. The coops should be well ventilated and dry. They need unlimited fresh air in order to develop their bodies at the fair rate at which they are expected to grow. But at night, when at rest, it is positively essential that the growing youngsters must have verminless quarters.

Let us look to the growing of the chicks this summer, for we cannot afford to let them get stunted or checked in any way. Those who cannot or will not give poultry regular or constant attention, shelter them properly, supply proper food in liberal quantities and at frequent intervals, and pay strict attention to cleanliness and thoroughness in all the details of the management, need not expect to succeed, not even consider the question of profit or loss, for success and profit here mean some work in the business. You need not hang a horseshoe over your door to bring good luck to your enterprise, for there is no profit in neglected poultry. It is true that nature helps the poultry raisers a great deal during the summer months, but it is equally true the successful poultry raisers must be watchful and careful during the warm days, as well as during the severe days of winter.

A bit of care and forethought will help to insure better success with the summer flock.

These measures are simply commonsense thought put into practice.

I attribute my success to my interest in the poultry work, and to a natural love for my birds. Also, to good care, housing and feeding. If you wish to succeed with poultry you must give some of your time each day to them.—Farm and Ranch.

CAPONIZE SURPLUS COCKERELS

THE operation of caponizing young cockerels is a very simple one when it is once known. It takes one who has had some little experience but a fraction of a minute to do the work, once the chick is in hand. The practice of caponizing or castrating the surplus cockerels is a common practice in England, and has been for years. It is also quite common in many sections of this country adjacent to the larger cities of the North and East. If for any reason you fail to find a ready market for your cockerels during the broiler age then it is that you can take the caponizing scheme and get them in shape to make great big roosters for the fall and winter markets, bringing good full prices. In fact, in many sections where they are commonly known for their wonderfully tender flesh, they are always in demand at top prices. True, some sections of the country need to be educated to use them. The best market for them is at the big hotels where the guests are of such a class as to readily appreciate their goodness.

When you find your cockerels are not going to sell as high-priced broilers, lose no time in caponizing, for the operation must be done while they are small, so that the risk will not be so great in losses. The older they get the greater the loss of blood, and necessarily the danger is more. A set of instruments, simple in their nature, is required, and these can be purchased at almost any house handling surgical instruments, and a good many houses handling a full line of poultry supplies. When properly done the specimen will hardly stop growing for a day. One can study the internal conditions of the male in dead specimens intended for the table and see the locations of the organs. Then it is a good plan, if such can be secured, to get the services of an expert to give a few practical lessons in the work. With a clear head and a steady hand one can soon become expert at the work.

Also explicit directions accompany the instruments, so that the novice has but little trouble to understand the operation. Prices for them usually run from $3.00 to $5.00. The best and largest capons usually are obtained from the Amercian varieties, such as the Rocks, Wyandottes, Reds, Jersey Giants, and the like. Sometimes good heavy game crosses are good. That is the Cornish variety. Should you live in a section not educated to the value of the capon, it may stand you in hand to do a little educational work in the way of visiting the fine hotels and restaurants, telling them what you have in prospect for them and asking them to take capons on as one of their Sunday dinner specials. Roast capon. When tried a few times their desirability readily becomes apparent.

CONTROLLING STRIPED CUCUMBER BEETLE

DURING the past five seasons, the Entomological Section of the Natural History survey has carried on experiments to test different methods and materials for controlling the striped cucumber beetle.

In the course of this work, many poison and repellent dusts and sprays have been tested. The best results have been obtained each season from a mixture composed of one part calcium arsenate to twenty parts gypsum. This mixture was first tried by the Ohio Agricultural Experiment Station, and after three years of tests at that station, was recommended by them as the best material of controlling the striped cucumber beetle. The Illinois results have confirmed those already obtained at Ohio.

Calcium arsenate, or arsenate of lime can be obtained from any large dealer in insecticides. Gypsum, in the form of land plaster, can be purchased from nearly any lumber yard. In most cases, this will be the burned gypsum, and will contain some fibre as it is prepared for use in making plaster. This may be easily sifted out and the material then mixed at the rate of one pound of arsenate of lime to twenty pounds of gypsum. Be sure that the two substances are thoroughly mixed. This may be accomplished by running the two thru a screen several times, or by putting both substances in a barrel, keg, or tin pail with a tight cover, and rotating the container for several minutes. A screen or partition should extend part way across the inside of the container to insure a more thorough mixing of the contents. This dust may be applied to the young cucumber plants by means of the ordinary dust guns, or blower dusters, or by a home made shaker. The shaker is made by nailing a wooden extension bail to the sides of a half gallon tin pail or bucket having a tight fitting lid. Punch holes in the bottom of the bucket with an eight-penny nail at the rate of four holes to the square inch. These holes should be punched from the outside in. Fill the bucket half full of the dust and apply by a shaking or jiggling motion. The first application of the dust should be made as the cucumber plants appear above the ground and should be repeated at five or seven day intervals until the vines have reached a length of two or three feet. If heavy rains occur, dust immediately after the rain ceases, even though an application may have been made just before the rain. Be sure the leaves of the plants and the surface of the ground around the stems are kept covered with the dust.

A two per cent nicotine dust has been included in these tests during several seasons, and has generally stood second to the calcium arsenate, gypsum mixture.—W. P. Flint.

BY CULLING THE FARM FLOCK YOU REDUCE EGG COSTS

(Continued from Page 4)

reduce the number of cull hens produced each year and moreover will result in the development of a high producing family or strain capable of both heavy winter and annual production. This calls for close observation of head characteristics which can be interpreted in terms of production and breeding qualities.

The head indicates more accurately the delicacy and efficiency of the internal mechanism responsible for egg production than any other section.

All hens can be roughly classified into one of five groups.

The crow head type as illustrated in Fig. 4, is a certain indication of low vitality. The long, straight, narrow beak, sunken eyes, narrow skull is characteristic of a constitutionally poor producer and a breeder of slow feathering deformed chicks.

The Overly refined type of hen illustrated in Fig. 5 is comparable to the Island Type of Jersey Cow. They possess the desired nervous organization associated with laying temperment, but lack capacity for heavy and sustained production. Such individuals, if early hatched, will usually go through a false moult in the fall or early winter. This is caused by a loss of body weight, which indicates the necessity of a special feeding practice, for hens of this class if high winter egg yields result.

The Refined type illustrated in Fig. 6 reveals the alert, feminine, expression that is so closely associated with the responsive and ambitious disposition common to the genuine egg laying machine. The head is of medium length, avoiding the short thick conformation of the beefy type. The skull is moderately narrow, flat on top, and the jaw should not be course and thick. The skin lining the face should be extremely thin and delicate, giving the face a lean dished appearance. The eye should be prominent, buldging, expressive and placed well back in an oval eye socket. This gives a placid, feminine, and intelligent appearance to the face. Such hens are usually solid, well-fleshed, compact individuals, with a deep wedge shaped body and broad flat back. They do not find regular production a physical strain and are able to withstand heavy forcing.

The fourth group of hens as illustrated in Fig. 7 are distinctly lacking in character and very much inclined to put on fat. Frequently such stock is produced by breeding from slow growing, coarse boned, over-sized males.

The last group consisting of masculine individuals are readily identified by the long pendulous wattles, coarse upstanding comb, male voice and characteristic deep-red color of face and head appendages. The male birds usually accord such individuals the same treatment, dealt to ordinary males. This group is illustrated by Fig. 8, a typical specimen.

Hens of the "Refined" group should be used exclusively as breeders, and will, if properly mated, solve future problems of economic production.

OH, MONEY! MONEY!

(Continued from page 10.)

"You got one! Do you mean that you've already sent this money?" cried Miss Maggie.

"Why, yes, of course. I stopped at the office on the way down here."

"And you sent—a money order?"

"Yes. He said he would rather have that than a check."

"I don't doubt it! You don't seem to have—delayed any."

"Of course I didn't delay! Why, Maggie, he said he had to have it at once. He was going to be turned out—turned out into the streets! Think of those seven little children in the streets! Wait, indeed! Why, Maggie, what can you be thinking of?"

"I'm thinking you've been the easy victim of a professional beggar, Flora," retorted Miss Maggie, with some spirit, handing back the letter and the picture.

"Why, Maggie, I never knew you to be so—so unkind," charged Miss Flora, her eyes tearful. "He can't be a professional beggar. He said he wasn't—that he never begged before in his life."

Miss Maggie, with a despairing gesture, averted her face.

Miss Flora turned to Mr. Smith.

"Mr. Smith, you—you don't think so, do you?" she pleaded.

Mr. Smith grew very red—perhaps because he had to stop to cough again.

"Well, Miss Flora, I—I'm sorry, but I'm afraid I shall have to agree with Miss Maggie here, to some extent."

"But you didn't read the letter. You don't know how beautifully he talked."

"You told me; and you say yourself that he gave you only a post-office box for an address. So you see you couldn't look him up very well."

"I don't need to!" Miss Flora threw back her head haughtily. "And I'm glad I don't doubt my fellow men and women as you and Maggie Duff do! If either of you knew what you were talking about, I wouldn't say anything. But you don't. You can't know anything about this man, and you didn't ever get letters like this, either of you, of course. But, anyhow, I don't care if he ain't worthy. I wouldn't let those children suffer; and I—I'm glad I sent it. I never in my life was so happy as I was on the way here from the post-office this morning."

Without waiting for a reply, she turned away majestically; but at the door she paused and looked back at Miss Maggie.

"And let me tell you that, however good or bad this particular man may be, it's given me an idea, anyway," she choked. The haughtiness was all gone now "I know now why it hasn't seemed right to be so happy. It's because there are so many other folks in the world that aren't happy. Why, my chicken and turkey would choke me now if I didn't give some of it to—to all these others. And I'm going to—I'm going to!" she reiterated, as she fled from the room.

(Continued in July 19th Issue.)

Two small boys were puzzling their brains to invent a new game. At last one of them said, eagerly: "I know Billy, let's see who can make the ugliest face."

"Aw, go on!" was the reply. "Look what a start you've got!"—[Pathfinder.]

MARKET FLASHES

MARKET SUMMARY

All grains are steady. Bean market quiet. Potatoes easy. Large supply of strawberries and prices lower. Receipts of butter and eggs ample to take care of demand. Poultry steady. Cattle dull. Hogs and sheep lower.

(Note: The above summarized information was received **AFTER** the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press.—Editor.)

FOOTE'S MARKET LETTER

BY W. W. FOOTE

Improved Farmers' Outlook

THE future certainly looks brighter for farmers as a class, especially for those who are so fortunate as to be out of debt and whose farms carry no mortgages. Farmers who always diversify their crops have suffered much less from the fall in prices for farm products than the one-crop farmers, and averaged sized farms where the crops are corn, oats, and clover are the rotation and where cattle and hogs are fed are making good records. So are the Michigan fruit and berry farms, and it now looks like a return to good times for wheat farmers, thanks to the reduced acreage. It certainly is refreshing to note the recent rising prices for wheat and other grains after the long period of cheap wheat, and it is sincerely hoped that painful experience will lead farmers to avoid being exclusive growers of wheat in the future. On the other hand, there is a possibility of going too far in the other extreme, and the United States Department of Agriculture a short time ago announced that agricultural production has arrived at the best general balance since 1920, but a note of warning was sounded that the balance might be upset by the tendency to overdo poultry, corn, butter and potato production and to cut down too far on wheat, beef cattle and hogs. Of course, power on a farm is important, and both tractors and horses perform a great part, while sheep and other live stock perform great things in maintaining the fertility of the soil. The banks are doing a good work by making loans to farmers and stockmen at reasonable rates of interest, the prevailing rates being lower than a year ago. Our foreign trade is increasing, the exports for the last eleven months being valued at $4,005,769,828, an increase of $369,000,000 over the preceding corresponding period; while our imports aggregated in value $3,282,206,631, a decline of $178,500,000.

The Boom in Wheat

It must be admited that even ardent bulls who believed all along that higher prices were coming before long have been surprised by the recent steady upward movement in quotations, subject, of course, to the inevitable reactions caused by realizing by speculative traders. The fact is, at last wheat has advanced on its merits, and that means it is realized that the world production promises to be so much lowered that there will be no large surplus. Every farmer who owns wheat knows that for many weeks the price in the Chicago market hung around $1.04 a bushel, with fractional advances and declines from week to week. Prices stood far below those paid two years ago. Now they are far above those of recent years, with late sales of July wheat as high as $1.17¼. The crop reports are closely watched by traders, and all accounts agree that the crop will be short and wanted at good prices. That there is an awakening of the public as to the world wheat situation is indicated by the increasing outside buying in all markets, in Canada as well as in the United States. Meanwhile, winter wheat is being harvested in the southwest, and some has been purchased for export. A year ago July wheat sold at $1.01½.

Higher Prices for Corn

The late corn planting is a big factor in the market, and sharp advances in prices have taken place of late, with sales of July corn as high as 96⅞@97¼ cents. Oats and rye shared in the upward movement, and the several grains sold at the highest prices yet touched. Further advances are expected, and there are predictions of dollar corn. Rye is wanted at last for export, but not much corn and oats are leaving the country. Cold weather has kept corn backward seriously, and farmers are withholding old corn from the market. Late sales were made of July oats at 54½ cents, comparing with 40¾ cents a year ago, while July rye sold at 81¾ cents, comparing with 62⅞ cents a year ago.

Recent Decline in Cattle

The cattle market is extremely sensitive to the dressed beef trade, and recently the packers have been unusually careful in their purchases of cattle on the Chicago market, buying only about enough for their immediate requirements, and no efforts were made to increase holdings of beef in their coolers. The beef trade is highly sensitive to the weather, and a falling off in the demand for beef is reflected at once in the live stock market, regardless of the immediate supply. A short time ago there was the worst slump in prices seen this year, due not so much to large offerings as to the poor demand for beef. After prices were forced to a remarkably low level, a great falling off in the receipts followed, and the decline was largely recovered, but cattle were far below the high time several weeks ago. Beef steers have sold of late largely at $7.75 to $9.75, with the better class of long-fed weighty cattle selling at $9.75 to $10.60 and the best yearlings marketed bringing $10.15. Sales were made of a good class of steers at $9 to $9.70, and sales were made all the way down to $6.75 to $7.75 for the cheaper little yearling steers. Butcher stock shared in the ups and downs of steers, with sales of cows and heifers at $3.50 to $9.25, while canner and cutter cows went at $2 to $3.40, bulls at $3.50 to $6.50 and calves at $5 to $10.50. For several weeks prices for stockers and feeders have been going lower, and they are offered at bargains, but the demand is still very poor. Late sales were made of these cattle at $5 to $8, mostly at $5.50 to $7.50, while stock cows and heifers sold at $3.75 to $5.75. Combined cattle receipts in twenty markets for the year to late date amount to 6,017,000 head, comparing with 6,039,000 a year ago.

Normal Cattle Feeding

Plenty of cattle are being prepared for the market in feeding districts, and nearly every Monday good numbers of choice heavy steers arrive in the Chicago stock yards, these shipments coming mainly from Iowa, Nebraska and South Dakota. Most stockmen refrain from the practice of long feeding, but those who are in the game report that they find it profitable, and most of them have been in the business for years. Of late the cattle offered on the market have included increasing numbers of grassy steers and cows, and they are discriminated against by butchers, selling at a big discount. Very few well finished yearlings are going to market, and a limited number sell at a good premium over the next best grade. The best beef cattle are selling far below the best time this year, when the top stood at $12.60, but the call for thin cattle for finishing purposes has checked the decline in the commoner light steers. On the whole, cattle prices have been remunerative for the farmers who prepared them for the market, but prices look low if one looks back and recalls that four years ago beef steers were selling for $10 to $16.90. On the other hand, two years ago they sold at $7.25 to $9.75, while three years ago they sold at $6.40 to $9.15.

The packers have been complaining recently of the poor yield in receipts of hogs, due to poorer quality and the increased proportion of common grassy and half finished droves. They are discriminating against these offerings, making a wider range of prices. Prime heavy butcher hogs continue to top the market, with the best light bacon weights selling about 20 cents below them. Owners of hogs that are doing well should market them as soon as ready, but feed should not be stinted, as that is a losing game. As to prices, it is simply a matter of how long the hog supply holds out; after marketings diminish materially it is safe to look for substantial profits. Should the weather be unfavorable for corn, corn prices would naturally advance, and that would probably result in larger marketing of swine temporarily. The raising of pigs for feeding purposes is being revived, and this is quite a help to stockmen in the corn belt. Combined receipts of hogs in twenty markets for the year to late date aggregate 22,307,000 head, comparing with 21,565,000 a year ago and 16,848,000 two years ago. A year ago hogs were selling at $5.70 to $7.30, while two years ago they sold at $8.85 to $11. Late sales were at $6.20 to $7.30.

Lamb Prices Tumble

As happens every year, prices for spring lambs offered on the Chicago market started off extremely high because of scanty offerings, while later on much larger receipts enabled buyers to make selections at rapidly falling values. The decline was finally checked after the best lambs had fallen to $13.75, comparing with $17.25 two weeks earlier. Idaho feeding lambs had a good demand at $11 to $12, and there were increasing calls for breeding ewes, including yearlings, at $6 to $10. Turning backward, it is recalled that one year ago prime lambs brought $15.50, two years ago $13.50, three years ago $11 and nine years ago $10. Fed sheep are offered for sale. Combined receipts of sheep and lambs in twenty markets for the year to late date amount to 6,110,000 head, comparing with 6,454,000 a year ago and 7,126,000 three years ago.

WHEAT

In spite of a nervous condition in the market and many sudden changes nothing new developed at Detroit last week and prices made only slight changes. The news about wheat was not important. There was a continuation of active foreign business and domestic mills were buyers of wheat all the time. It is intimated that takings by Europe were greater than appeared in the dope, and that included a great deal for future delivery. They were buying against what appears like a shortage in the growing crop owing to reductions in the indicated production in all the leading exporting countries. The needs of Europe are said to be large and dealers are anxious to secure supplies as early as possible. While some reports are circulating about army worm and other injurious things, the general crop situation in the United States is favorable. Where harvesting has been done the outturn has been better than expected. The spring wheat crop has had enough rain to carry the plant for some time, but more is needed and there is some anxiety on that score.

CORN

Corn furnished some real excitement last week at Detroit and prices are materially advanced. The new crop is late and in a bad position. Weather has been unfavorable all spring and the plant is backward. The weeds have secured a good start owing to the rain that prevented cultivating operations and a great deal of the seed rotted in the ground. It will require the best of weather to get the crop in good shape. In the meantime the farmers are not active sellers of corn and the supply is short. The cash corn is largely in control of one man in Chicago and shorts appear to be in a bad fix.

OATS

Oats followed the trend of corn at Detroit during the fortnight ending Saturday, June 28, and prices are higher. Demand is fair while receipts are small.

RYE

Scarcity of rye abroad is giving the rye market a decidedly bullish tone. Stocks in this country are disappearing rapidly and Europe is expected to be a liberal buyer. The Detroit market gained 2 cents on Saturday of last week making a total gain of 4 cents for the week.

BEANS

Beans are quiet and steady after recent declines in prices. After steadily advancing for over a period of several weeks it was only natural that there should be some reaction and prices take a drop. Michigan beans are wanted and they are going higher in prices.

POTATOES

Old potatoes are without friends and prices took several drops during the last couple of weeks. A dull tone prevails in the market. New potatoes are coming to market in fair volume and the demand is good so there is no accumulation.

HAY

Hay markets in general show less strength. Prices are steady in the markets where receipts are small but lower where receipts are heavy. Demand is for good hay and this is in very small receipts at all markets.

MARKET QUOTATIONS

Detroit—No. 1 timothy, $23.50@$24; No. 2, $21@$22; No. 1 clover,

$19@$20; standard and light mixed, $22.50@$23 per ton.

Chicago—No. 1 timothy, $24@$26; No. 2, $21 @$23; No. 1 clover, $20@$22; standard and light mixed, $23@$25 per ton.

Prices one year ago—Detroit, No. 1 timothy, $17.50@$18; No. 2, $15.50@$16.50; No. 1 clover, $12 @$14; standard and light mixed, $14@$15 per ton.

PRITCHARD'S WEATHER FORECAST
INTERPRETED BY THE STARS

Week of July 6

TEMPERATURES generally throughout the week in this state will remain above the seasonal normal.

Rains and thunder storms will be ending in Michigan about the time this week begins but there will probably be a reaction to thunder showers and local rains about Tuesday or Wednesday. Conditions will again become unsettled and stormy about Friday and Saturday.

There will be a marked change to cooler on the last day of this week or the very beginning of next.

Week of July 13

Temperatures during the greater part of this week will be on the climb starting early in the period to advance. By Monday or Tuesday temperatures readings will be considerably above the seasonal normal.

Sunday will probably be a fair day but immediately following the sky will become threatening and rain and thunder storms will be in evidence in scattered parts of the state. Just before or close to the middle of the week the winds will increase in force and some small gales may be reported in and around Michigan.

The latter half of this week promises better weather both in temperature and sunshine but by Saturday will break down under the strain of a decided summer storm period. Electrical storms will be numerous; rainfall will be heavy and general and the winds will be strong in force. The week goes out with rain, thunder and high winds visiting most parts of the state of Michigan.

FARMERS' DAY AT M. A. C. AUGUST 1

THE seventh annual Farmers' Day at Michigan Agricultural College will be Friday, August 1, the committee in charge of arrangements has decided. E. B. Hill, assistant to acting president Shaw, is chairman of the committee. The special feature to be stressed during the day has not been picked, but it is expected to be some phase of marketing.

The first Farmers' Day was held in 1918, when a number of Michigan farmers were called together to discuss the governments request for an increase in the acreage of wheat. With the war ended, the next year's session was devoted to soils. With the third year the day was made a general "college day." The attendance has been approximately 5,000.

OUR BOOK REVIEW

(Books reviewed under this heading may be secured through The Michigan Business Farmer, and will be promptly shipped by parcel post on receipt of publisher's price stated.)

Review of the 1923 International.—This cloth-bound volume not only gives a complete history of the last International Live Stock Exposition but also contains splendid pictures of the champions, of the educational exhibits, the boy and girl trip winners, as well as many other interesting features. The cost, while the limited supply lasts, is only $1.00 per copy, which charge is made to cover postage and mailing expense, though the cost to the "International" of these books is considerable more that that. Published by International Live Stock Exposition, Union Stock Yards, Chicago, Ill.

Prices of all breeds of purebred beef bulls combined during 1923 were steady with those in 1922 but heifers and cows were lower, according to reports submitted by breeders to the United States Department of Agriculture. Average prices ranged from $79 per head for heifer calves to $185 for bulls over three years of age. The breeds included were: Aberdeen Angus, Hereford, Red polled and Shorthorn. Bulls, cows and heifers over one year and under three years of age brought $30 more per head at auction than at private sale but in the case of all other ages auction prices were practically the same as those received when the animals were sold privately. The top price reported for males was $5,000 and for females $1,550. The report shows that some of the prices were very little if any higher than central market prices for the better grades of steers, which accounts for the large number of breeders castrating their bull calves and selling them as steers. Such a period of low prices usually means ruin for a large number of breeders but it tends to weed out much of the poor quality stock, reduce the surplus and generally raises the price level of the stock held by the breeders who survive, the department says.

Offer Farmers Billion Dollar Grain Business

GRAIN farmers would own, finance and control five large Chicago grain firms and 5,000 co-operative elevators under a plan which has been submitted to the executive committee of the American Farm Bureau which has named a committee, headed by O. E. Bradfute, president, to study the scheme.

The plan includes the Armour Grain Company, Rosenbaum Grain Corporation, Bartlett, Frazier & Co., Resenbaum Brothers, and J. C. Shaffer & Co., handling more than $1,000,000,000 worth of cash grain transactions annually, according to estimates of the aggregate business of the last few years.

The proposal contemplates turning over to the farmers the firms' 40 country elevators, terminal elevators, offices and fixtures and all other mechanical equipment, along with managerical facilities. The five firms involved control virtually the entire elevator capacity at the Chicago terminal and much of the capacity in other primary markets and export bases. The elevators are valued at $15,000,000 and other property at about $8,000,000.

Co-operative grain marketing organizations eventually would receive the trading privileges of the Chicago Board of Trade, under the proposal.

Details of financing reaching to hundreds of millions of dollars will be considered by the committee. The financing of the consolidation is expected to be cared for with the funds which ordinarily make the "rebate" to the producer under co-operative market systems. These "rebates" might be diverted into a sinking fund for the amortization of the consolidation debentures, stocks and bonds, it was suggested, although the legal and financial details of the plan were not made public.

The announcement of the plan, made by the farm bureau, said the company contemplated would be at the service of state co-operative pools, elevator exchanges, farmer-owned elevators and individuals as a grain merchandising agency. "It is understood that the tentative plan has been submitted to other farm organizations," the announcement said.

Farm bureau officials, who have been considering the plan for some time, were reported as being friendly toward the proposition. Grain operators considered it with favor.

"The American farmer has been groping in darkness," said John J. Stream, former president of the Chicago Board of Trade. "He has had the cooperative idea, but has not had the facilities to put it into execution. Now men who have devoted their lives to grain marketing, and who control five of the largest grain companies in the world, offer to turn their properties over to the American farmers and offer to devote the next five years to the project, and then stand ready to turn the entire properties over to persons designated by the farmers to conduct the business."

If a final agreement is reached between the farmers and the five grain companies, it is predicted that it will take at least three months after that to complete the unified plan.

The Truth in Feeds

Monday, July 7th.

From Monday, July 7th, until Saturday, August 9th, farmers may contract with the Michigan State Farm Bureau through their local agent (co-operative association or farmer representative) for fall and winter supplies of Michigan Milkmaker dairy feed.

For two years past thousands of farmers have thus contracted for their winter Milkmaker requirements. This plan has proved itself to be the economical way to buy feed. Delivery is made to local agents in six monthly shipments, this year between September 1, 1924 and February 28, 1925. Contracting farmers pay for the feed on delivery.

Milkmaker is 24% protein and manufactured under public formula. Every ingredient is listed on the tag, pound for pound. It is the best dairy concentrate to be had for economical milk production. Each ingredient is carefully chosen for its high and easy digestibility, its palatability and its efficiency as a milk producer. With Milkmaker you know what you are feeding.

Milkmaker does exactly what you expect of such a feed—it increases production, lowers feeding costs, keeps the herd in high condition. Cows like it tremendously.

Positively no applications for contracting 1924-25 Milkmaker can be accepted after August 9th.

Polarine

THE PERFECT MOTOR OIL

Made in Five Grades

is Checked Step by Step

From the selection of the crude, through the intricate processes of manufacture, to the final behavior of the oil under every day field conditions, Polarine is checked and re-checked at every step.

Every gallon must conform to rigid requirements laid down by the engineers who developed it.

Only by safeguarding it in this thorough manner can the Standard Oil Company (Indiana) give its unqualified guarantee that you will get what you pay for.

If you will use the grade of Polarine recommended for your tractor in the chart at the left, you will get perfect lubrication—you will use less fuel—you will save repairs—you will get all the power your engine can develop—you will add to the life of your tractor.

For Polarine lubricates the remotest frictional parts—it maintains an unbroken film of oil to protect the bearing surfaces—it holds its body under all working conditions.

Follow the chart at the left and give your tractor accurate, scientific lubrication.

Drain your crankcase frequently and refill with the correct grade of Polarine. It pays!

The Wheat Situation in Michigan

By H. R. SMALLEY

MANY MICHIGAN farmers are wondering whether or not to seed wheat this fall and, if so, how much? If looked at from the standpoint of price it is certainly a debatable question, but it is a many-sided subject and cannot be decided on the basis of price alone.

Farmers are not willing to let their land lie idle and although there is considerable talk of abandoned farm houses, the land itself is being cultivated. Farmers in Michigan are working harder and longer hours, and in many cases they have increased their efficiency by buying tractors and other labor-saving machinery. Many will doubt the above statement, but statistics compiled by the United States Department of Agriculture show that the total acreage of crops harvested last year was larger than in 1920 when prices of all farm products were high at least until after the crops were all planted.

Going farther into the same figures we find that the six crops—corn, wheat, oats, rye, potatoes, and hay—occupy 85 out of every 100 acres of crops in the state. The acreage of these crops is large enough at present. The acreage of vegetable and fruit crops cannot be increased without serious over-production. The big question then is what can be done with a million acres of land now in wheat, if wheat growing is to be discontinued?

The answer is simple. Wheat growing will not be discontinued in Michigan. The State has a tremendous city population within its borders and it is good business and sound economy for Michigan farmers to supply local markets first. Last year the Michigan wheat crop lacked three million bushels of supplying the bread needs of the state. This fact suggests, not a larger acreage, but a higher yield per acre. Then wheat has some other strong points in its favor. It is a cash crop, and the only one on many farms. It is an excellent nurse crop for clover, and every farmer knows the value of clover as a soil builder and rejuvenator. Also wheat fits nicely in the rotation with corn, other small grain, potatoes and hay.

However, there is much room for improvement of the Michigan wheat crop. The average yield is only about 15 bushels to the acre for the state as a whole, which means that half the farms that grow wheat are below the 15 bushel mark. Then much of the grain is of poor quality, especially where the yield is low. No one has ever yet devised a system of cost accounting that will show much of a profit on a poor crop. In other words, low yield and low cost have never been found hobnobbing together in the same field, and it is generally true that a high acre yield means a low cost per bushel.

One of the chief problems of the wheat grower, therefore, is to get the yield up and the cost per bushel down. Wheat growers of the state can well afford to study this question carefully. More attention than ever before should be paid to the seed wheat. It should be certified if possible or at least it should be of a good variety. It should be free from weed seed and also from disease. It should be treated for smut unless it is known to be "smut free." All plowing should be done as early as possible in order to get the "settling" effect of early fall rains, and the land should be worked down thoroughly so that the seed bed will be firm. Finally, fertilizer should be used more liberally.

A further word in regard to fertilizer is perhaps in order, since the use of the right analysis and of a sufficient quantity is of such great importance. In fact, it is scarcely worth while to sow wheat in many parts of Michigan without fertilizing. Besides, fertilizer applied to wheat benefits the whole rotation, its effect being most striking on the clover crop following wheat. In deciding on how much fertilizer to apply, this fact should be borne in mind. A common application of fertilizer on wheat is 125 to 150 pounds per acre, but this doesn't leave much for the clover. It will be better to use 250 to 300 pounds to the acre and give the clover crop a chance to pay the whole fertilizer crop bill which it will usually do. Experiments conducted in many localities show that such an application of fertilizer will increase the yield of wheat by 5 to 15 bushels per acre and the yield of hay by a quarter of a ton to a ton to the acre the following year.

It is not safe to give advice as to just what fertilizer analysis to use without knowing the kind of soil and how it has been cropped and handled. The Michigan Agricultural College has selected a standard list of fertilizer analyses for all soils and crops. All recommendations are made from this list which is considered sufficient to meet the needs of all Michigan framers. Ask your county agent for a copy of Circular 53, "Standard Fertilizers for Michigan" or write to the M. A. C. for it.

The Michigan Agricultural College has done much to make wheat growing more profitable in Michigan. The Farm Crops Section has tested literally hundreds of varieties to find those best suited to Michigan. New varieties, the most promising of which is Red Rock, have been originated. Many fertilizer experiments have been carried on by the Soils Section in all parts of the state which make it possible to make reliable and valuable recommendations. Besides all this, the agricultural college makes careful studies of all diseases, devises methods of seed treatment, and keeps a line on all insect pests. The "fly free" date for seeding is checked up accurately each year so that farmers may know the best possible time to sow their wheat.

Those farmers who take advantage of the opportunities that are open to them for increasing the yield and improving the quality of their wheat will not find it difficult to grow from 20 to 30 bushels to the acre, thereby greatly reducing the cost of producing a bushel and increasing the profit accordingly.

SWINE INDUSTRY DECLINES

THE Federal pig survey taken throughout the United States several weeks ago by rural mail carriers has been tabulated by the Bureau of Agricultural Economics and indicates a marked reduction in the swine industry from the high level of the last two years. The results, as released by Verne H. Church, Agricultural Statistician for Michigan and L. Whitney Watkins, State Commissioner of Agriculture, show that the farmers of Michigan saved 81.2 per cent of the pigs farrowed this spring as compared with one year ago is 78.5 per cent in Michigan, 79.7 in the corn belt, and 78.8 in the entire United State. The number bred for fall farrowing as compared with last year is 88.7 per cent in Michigan, 88.6 in the corn belt, and 94.1 in the United States. The average number of pigs saved per litter shows some advantage in Michigan over other states being 5.7 as compared with 5.02 in the corn belt and 5.05 in the entire country.

DAIRY BUREAU ESTABLISHED IN DEPT. OF AGRICULTURE

THE establishment of a Bureau of Dairying in the United States Department of Agriculture was announced on July 2 by Secretary Wallace, and at the same time he announced the appointment of Dr. C. W. Larson, Chief of the Dairy Division in the Bureau of Animal Industry, as chief of the new bureau. The act of Congress, creating the bureau, approved by President Coolidge on May 29, provides that the Secretary of Agriculture may transfer to the Bureau of Dairying such activities of the Department of Agriculture as he may designate as primarily related to the dairy industry. All of the dairy work heretofore carried on by the Bureau of Animal Industry has been transferred to the Bureau of Dairying and about 150 employees of the Dairy Division have been shifted to the new bureau. Appropriations for the new fiscal year for carrying on dairy work in the department amount to approximately $400,000.

Michigan's "Blue Sky" Law is Good, But Beware!

Securities Commission Cannot Stop Salesmen of Worthless Stock From Using Mails

By STANLEY M. POWELL
(Lansing Correspondent of The Business Farmer.)

> **"WE believe that our Michigan 'Blue Sky' law is the best piece of legislation of its kind in the United States, but what we must do now is to educate the people up to the law," says Mr. Duff.**
>
> **"We can say quite definitely and with complete assurance that the sale of phoney stock has been reduced to a minimum. There is practically no unauthorized stock sold except by mail. The Commission has absolutely no jurisdiction over the mails at the present. Stock salesmen and promoters can promise almost anything through the mails if they do not misrepresent an existing fact. When they get too reckless, the federal authorities bring them to time. It will be remembered that Dr. Cook and his crowd got too bold in their dealings in Texas oil. They next began operations in California, but being chased out of there, have now established their headquarters in Mexico."**

NO doubt thinking that The Business Farmer family after reading "Forty Years of Faking" would be wondering what was being done to protect the purchasers of stocks and bonds in Michigan from the slick and deceptive practices of unprincipled promotors, the editor asked me to make a study of our so-called "Blue Sky" law and to investigate whether or not it is working satisfactorily.

With a rather vague general knowledge of the Michigan legislation along this line, but with a determination to find out the real facts about the matter, I made arrangements for an interview with Mr. H. N. Duff, Chairman of the Michigan Securities Commission, which is the state department having the administration of our state "Blue Sky" law in charge.

I had known Mr. Duff when he, too, was in the journalistic game, so I was assured that I would not find him a man difficult to interview. In this I was not mistaken. After a brief explanation of my errand, he launched at once into a discussion of the subject regarding which he is so well qualified to speak.

Mr. Duff's Advice to Farmers

"You have given me a big order," began Mr. Duff, "but I am glad to supply you any information which I can or any assistance which I may be able to give. You tell your readers that if the public, the farmers especially, would not be rushed off their feet by stock salesmen and would not sign on the dotted line whenever someone waves a fountain pen in front of them, we can save them a lot of money.

"We believe that our Michigan "Blue Sky" law is the best piece of legislation of its kind in the United States, but what we must do now is to educate the people up to the law.

"Michigan has been the pioneer state in the protection of its investing public. There have been two Attorney Generals in Michigan who have given this matter considerable study and as a result of whose labors, the present satisfactory legislation has been enacted. The first measure of this kind was passed in 1915. It was drafted by Grant Fellows, who was then Attorney General. All "Blue Sky" laws in the United States really date from that 1915 act.

"But in the administration of the law of 1915, practical difficulties soon arose. In the first place, that law was based on industrial and financial conditions prior to the World War. It did not prove perfectly adapted to the changed conditions which soon developed.

"Then, too, we were treading upon new and unexplored territory. We had no judicial precedent. It was not until 1917 that our law was finally declared valid by the United States Supreme Court. A decision handed down that year upheld the Michigan, Ohio and South Dakota laws and gave us a substantial basis for our actions. In 1921 the law was considerably amended and materially strengthened and then in in 1923 our present new, and as we think, model law was enacted.

New Law Stops the Leaks

"The 1923 law is working very satisfactorily and it looks as if we had stopped all the old leaks, but whether it will be completely successful or not, only time will tell. You remember that we are dealing with the cleverest bunch of people on earth and if there is a loophole anywhere, they will find it.

"When I say that it looks as if we had pretty effectively stopped all the leaks which existed in the old law, don't think that no one has lost any money on stock and bond transactions in Michigan recently. We can't prevent a man from gambling. As long as there are men who want "to take a chance" and think they can get rich over night, they will be susceptible to the fellow with a get-rich-quick scheme. There are certain well known rates of interest and a person who is offered something which promises fabulous returns, either as to interest or increased value of principal, had better beware.

Stock Not Guaranteed

"In the public mind there has been some misconception of the work of this commission. It should not be believed that the commission guarantees the stock which it approves and accepts for sale under its supervision. If three men could pass on $1,090,000,000 worth of stock in a year as we did in 1923, and absolutely guarantee against any loss, we would not be working as state employes, but would be ranked among the leading financial wizards of the nation. J. P. Morgan would probably have us as his advisors."

The talk having turned to the subject of losses through the purchase of stock which did not prove out, I interrupted Mr. Duff to inquire what were the probable losses per year from this source in Michigan.

"There is no way of determining that even approximately", replied Mr. Duff. "Our commission turned down about $200,000,000 worth of stock last year. There are, of course, two chances for losses. In one case the deal is bad from the beginning, in the other the company fails or is unable to pay dividends. There are two questions generally accepted in the investment world. The first is that 90 per cent of the companies which are organized fail and go to the wall in the first two or three years, and the second is that nine out of ten people who buy stock lose money.

No Control of Mail Swindlers

"We can say quite definitely and with complete assurance that the sale of phoney stock has been reduced to a minimum. There is practically no unauthorized stock sold except by mail. The commission has absolutely no jurisdiction over the mails at present. Stock salesmen and promoters can prom-

(Continued on Page 23)

Do You Favor An Intensive Navy Bean Advertising Campaign?

AN advertising committee has been appointed by the bean growers and jobbers in Michigan who are interested in an advertising campaign to create a greater demand for choice navy beans. The committee is made up of five members, two representatives of the elevator men, two representatives of the farmers and the fifth member is Mr. H. E. Chatterton.

The two bean elevator representatives on this committee were nominated by the officers of the Bean Growers Association and approved by the Bean Jobbers Association in open session. The two representatives of the growers were nominated by the bean jobbers and approved by the growers representatives. Mr. Chatterton being the largest handler of beans in Michigan, if not in the United States and also an extensive grower was the unaminous choice of all parties concerned for the fifth member of the committee. Mr. Marotzke, Chairman of the committee, is secretary of the Thumb Bean Growers Association. This association has been very active in promoting the interests of an advertising campaign. In fact, great credit is due them for the present favorable situation. A. B. Cook was selected for secretary of the committee. The presumption is that this committee would have general charge of the advertising campaign if undertaken unless some way could be devised of selecting a committee which would be fairer and more satisfactory to those interested.

One of the first official acts of the committee was to issue the following statement to Michigan bean growers to be published in The Business Farmer:

"TO MICHIGAN BEAN GROWERS:—We the undersigned committee representing both growers and elevator men are unanimously and enthusiastically in favor of an advertising campaign in the interest of Michigan choice hand picked navy beans.

"We raised last year in Michigan 2/5 of all the beans raised in this country. We raised 2/3 of all Navy beans. The Government forcast for 1924 crop credits Michigan with practically 50 per cent of this year's total prospective bean crop. We contend that an advertising campaign of the character proposed is highly desirable if not absolutely essential if this enormous crop which is in prospect is to be marketed at increased and satisfactory prices. We contend that the farmers are willing to contribute for all the beans marketed by them on condition that their elevator contribute a like amount for the purpose of advertising Michigan choice hand picked beans. Our conclusion is challanged and doubted by some large elevator interests and we must present proof of favorable sentiment among the farmers before we can secure 100 per cent cooperation of the elevator interests. Please fill in the attached questionnaire and mail to the editor of this paper immediately. Votes to be effective must be in by August 10th.

"This is a proposition of vital interest to every Michigan bean grower and we shall expect an expression which in no uncertain terms shall represent the sentiment of a material percentage of the bean growers of Michigan." (SIGNED BY THE COMMITTEE) Gus Marotzke, Sebewaing (Chair.); A. B. Cook, Owosso (Secretary); H. E. Chatterton, Mt. Pleasant; J. E. Malone, Lansing; C. S. Benton, Lansing.

If you raise beans it is your duty to fill out the questionnaire so that the committee may know whether you are in favor of advertising or not. Don't let the other fellow do it, it's your vote they want. Mail it to the Market Editor, The Business Farmer, Mt. Clemens, Mich., so it arrives at this office not later than August 10th—but the earlier the better.

QUESTIONNAIRE ON BEAN ADVERTISING CAMPAIGN

Do you favor an extensive bean advertising campaign?

YES........... NO...........

Will you contribute 1c per hundredweight from the beans you sell for promoting and advertising the Michigan Choice Hand Picked pea bean, providing your elevator man contributes an equal amount and provided further that this movement shall be generally supported by the growers and elevator men of the State?

YES........... NO...........

No Peddling for Muskegon Farmers

On Market Days Nearly 1,000 Consumers Patronize Muskegon City Markets Buying Direct From Producer

By CARL H. KNOPF

"Jake" Hess is the market master and much of the success of the Muskegon markets is due to his good work.

THE marketing problem is always with us. This has probably been so ever since the first man produced a surplus of food or clothing and there is no good reason for supposing that it will ever be entirely solved. However, if you are fortunately located within marketing distance of a large consuming center, a farmer's retail market will go a long way towards solving your marketing problem.

Greater Muskegon includes the two cities of Muskegon and Muskegon Heights which have a total population of more than 52,000 people. To assist in supplying the food requirements of this army of consumers, three retail city markets have been established for the farmers. All of these markets are located within a radious of two miles from the center of Muskegon.

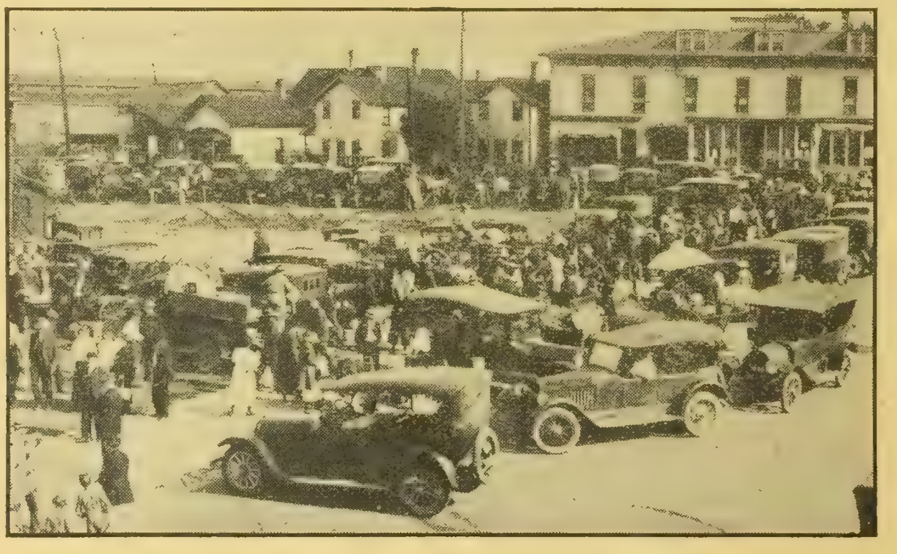
Prior to 1921 many efforts had been made to establish a city market in Muskegon. To relate the details of these several attempts would make a story in itself. Suffice to say that, for one reason and another, all of the attempts failed. It began to appear that the only way the farmers could dispose of their produce in Greater Muskegon would be to sell to the grocery stores or to peddle from house to house.

There may be some farmers who actually like to peddle their produce but I doubt if they are more numerous than 1 in 1,000. It is true that the old horse ambling along with the wabbly-wheeled spring wagon, while his owner attempts to sell "Ap-puls! Po-ta-toes! Melluns!" to the busy housewives, has given way to the no less wabbly-wheeled Ford, but it is also true that peddling still continues to be a long and tiresome method of marketing. A group of Muskegon farmers, convinced that there was a more efficient means of reaching the consumer directly, continued their efforts to secure a city market. Finally in 1921 they, assisted by their County Agricultural Agent, secured the passage of an ordinance establishing such a market and making provision for its regulation.

First One Established

The first market was established on the sight of the old hay market. This is a triangular shaped piece of land, about one-half of a city block in area. It is located at the junction of Clay Ave. and Ottawa St. and has come to be known as the Clay Ave. Market. As this location is somewhat north of the principal residental section of Muskegon the housewife usually must come some distance to reach the market. The big question troubling the minds of those promoting the market was, "Will the consumers patronize the market?" This question was definitely answered on the first market day, July 20, 1921. About fifty eager buyers, armed with pocket books and market baskets, visited the market place but, lo and behold, no farmers had appeared. True to the natural conservatism of the average farmer, each producer had decided to let the other fellow try out the market experiment first. When, two days later, the same thing was repeated, the market committee grew desperate. A market site and many buyers are essentials for a successful market but it is also necessary to have someone with something to sell. Accordingly the committee went forth and litterally dragged the farmers to market. The third market day therefore marked the beginning of actual business on the market as 11 farmers had at last decided to try their luck with the new venture.

Starting with the first fifty would-be purchasers the number patronizing the market has steadily increased. During the past season it is estimated that between 800 and 1,000 buyers patronized the market every market day. The majority of the market patrons are the housewives. They come on foot, with flivvers, and in limousines, and each goes away laden with bundles, sacks, and market baskets containing purchases of their own selection. Tourists, passing through on the trunk lines, are liberal buyers during the summer season and form no small portion of the total business of the market.



The Clay Avenue Market at Muskegon, Michigan.

Starting with the first venturesome eleven farmers, the number of producers using the market has also shown a marked increase each succeeding season. Farmers from all parts of Muskegon county use the market and, in addition, many farmers from Oceana, Newaygo, and Ottawa counties are regular attendants thereon. While a zone extending some 30 or 40 miles from Muskegon will include most of the producers who use the market regularly, still occasional loads come from much greater distances, in some cases as far as 200 and 300 miles.

The market season usually opens during the latter part of May or the early part of June, depending on the season. It closes in November, just before Thanksgiving.

The Clay Ave. Market is held on three forenoons of each week, Tuesday, Thursday, and Saturday. During its second season, 1922, this market became too crowded for the space available. At times more than 125 rigs would be parked in double rows around the three sides of the market space with many more rigs waiting to take stalls as soon as they were vacated.

In order to relieve the congestion and also to serve another section of the city, another market was opened on Beidler Street in the western part of Muskegon. This market is open on each Monday,. Wednesday, and Friday forenoon and has proven to be a very efficient unit in the system of city markets.

The third market of Greater Muskegon is located on Peck Street in Muskegon Heights. This was started in 1921 but during its first two years it had rather indifferent success. However, during the season just past, under a new market master it has been build up into a very successful market. The Heights market is held on Tuesday, Thursday and Saturday and is an all day market.

The total producer attendance on the two Muskegon markets for the season of 1923 was 4,622. This does not mean that 4,622 different farmers used the market but rather that 4,622 stalls were rented during the entire market season. The average attendance per market day during the 1923 season was 42 producers on the Clay Ave. Market and 26 producers on the Beidler St. Market. This represents an increase of more than 20 per cent over the previous season.

While the exact records were not kept for the Muskegon Heights market, it is certain that the daily average for that market during the past season was between 20 and 30 rigs.

The Market Masters

"Jake" Hess is the genial market master who has been in charge of the two Muskegon Markets during their three years of operation. Much of their success can be attributed to his tactfullness and common sense handling of difficult situations.

John Goldburg, always a staunch supporter of the Muskegon markets, was placed in charge of the Muskegon Heights market at the beginning of the past season and has guided it through a decidedly successful summer.

A feature of the markets during this past summer has been the close cooperation of the market masters. It one market had a surplus of a certain product while the other market was lacking in that line, the situation was adjusted by exchanging rigs. This worked to the advantage of both producer and consumer and also helped both markets.

All three of these markets are open air markets and the stalls are spaces whose boundries are indicated by marks of white paint. The stalls are 7 ft. and 3 inches wide and rent for 25 cents per day. In case a farmer desires to reserve a stall for a longer period he pays $5.00 for a six weeks rental of the same stall.

Most farmers who come on the market regularly prefer to hold the same stall so that purchasers learn to know their location. This enables the producer to establish and build up a trade with regular customers.

Under Farm Bureau Direction

During its first season the Muskegon market was operated under the direction of the city. Despite the success of the venture an announcement was made early in 1922 to the effect that the city could no longer continue its support of the proposition. At this critical point the County Farm Bureau stepped in and saved the market for the farmers. By thus rescuing the market and continuing to direct its affairs, the Muskegon County Farm Bureau has rendered a service which may well be placed near the head of the list of the many things which it has accomplished for the farmers of its jurisdiction.

The market fees, though small, are proving sufficient to meet the operating and miscellaneous expenses of the market and a small balance is left at the end of each market season. This surplus is placed to the credit of the market and is expended for improvements in connection with the market.

The growth of the Muskegon markets is proof positive that they are filling a very real need. No matter how small a quantity of produce a man may grow, if he can get it on to the market in good condition he can sell it direct to the consumer at prices which approximate the retail prices. All manner of farm products are brought to the market in rigs ranging from big trucks to boys' express wagons, proving that the market appeals to all classes of producers. The markets enable the farmer to build up a trade and to dispose of his products without using up his tires and gasoline in miles and miles of tedious peddling.

The advantage to the consumers is no less great. They can come to the markets, compare the quality of the offerings, make their selections, and know exactly what they are getting. Besides securing the articles in the freshest condition possible the buyer has the advantage of buying direct from the producers who know, and can guarantee the quality of their products.

No attempt is made to fix a scale of uniform prices. It is true, however, that there is very little variation in prices for produce of the same grade. The prices usually range about the same on the market as for similar produce delivered from the local stores. Should you ask, "What then is the advantage of the market to the consumer?" the answer is a repitition of that given above, namely, Freshness, Variety, Own Selection, and Guaranteed Quality.

The emphasis of the market is placed on quality. Inferior or damaged stuff is not tolerated. A salesman must tell the truth about the goods he offers for sale and there must be no deception in the way the goods are displayed. Some farmers who have attempted to evade these requirements, have found to their sorrow that it pays better to be square. In case of complaint about goods purchased on the market which have not proven satisfactory, the seller must make good or be barred from the markets.

Scales, weights, and measures are tested frequently to insure accuracy in measuring out the amounts purchased.

No "Hucksters" Allowed

One excellent feature of the Muskegon markets is that only producers are allowed to sell thereon and they are limited to the sale of their own products. Occasional hucksters have attempted to evade this rule but, upon being discovered, they have been "bounced" immediately.

While this rule may seem a trifle severe it must be remembered that the average huckster is not much concerned about the quality of his offerings just so long as they sell at a profit above the purchase price. Furthermore, the hucksters, in general, bring in their stuff from long distances and, as a consequence, it lacks the freshness and quality of the produce grown nearby. In selling his second grade produce at a second grade price the huckster also forces down the price on the better grade of produce to a figure which is unfair to the grower. In other words, the grower may get less than he should for his produce while the huckster may be making good profits by selling at a lower price some products which he purchased at an extremely low price from some farmers far distant and outside of the usual marketing territory.

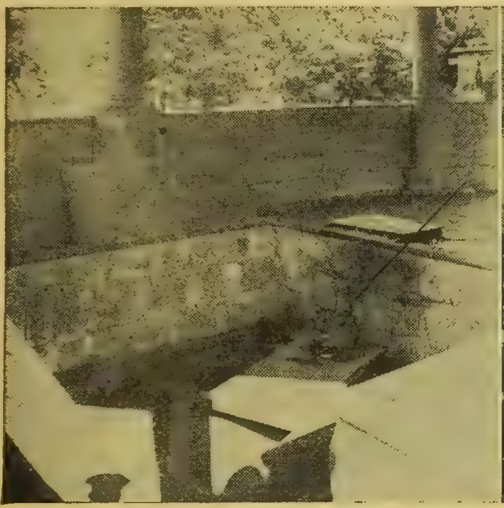
PICTURES FROM FAR AND NEAR



THE FOUNTAIN OF YOUTH.—This fountain, named by Ponce de Leon as his Fountain of Youth, is in the oldest city of the United States, St. Augustine, Florida.

THE DEAD LETTER OFFICE.—Many times letters written by our subscribers and intended for us go to this Dead Letter Office of the Post Office Dept., Washington, D. C., because they are addressed wrong, or address is unreadable.

GENERAL JOHN J. PERSHING.—Here we have Uncle Sam's famous military leader, General Pershing, in the garb of an American business man. He was on a vacation.

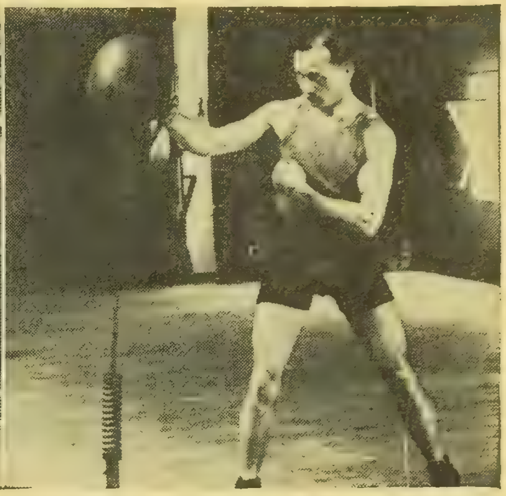
LISTENS IN ON SON'S TALK.—John Coolidge, of Plymouth, Vermont, father of President Coolidge, is here seen listening in on his radio receiving set to a talk being given by his son. The set is on the same table with the Bible which was used in swearing in the Chief Executive at the death of the late President Harding.

DISCOVERER OF INSULIN MARRIED.—Left to right: Miss Marion Robertson, of Elora, Ontario, just after her marriage to Dr. F. G. Banting (right) world famous discoverer of Insulin, the cure for diabetes.

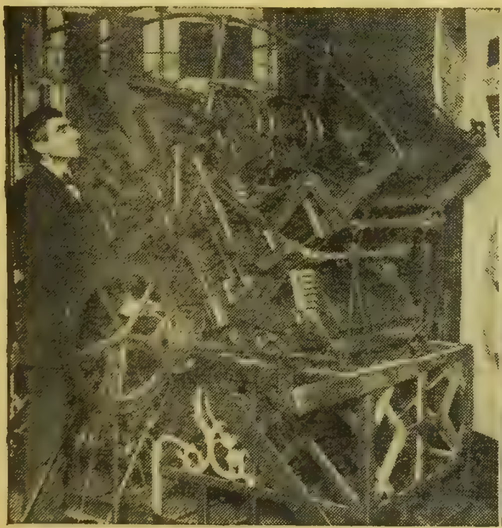
A SUMATRA BUTCHER.—It may seem strange, but it is a known fact that meat is very scarce in Sumatra, and men such as this can be seen on the streets daily with dogs in tow, which they sell to customers. When the sale is made, the big knife comes out and the dog is killed.

ARCHDUKE CLAIMS HE STILL OWNS PROPERTY WORTH $100,000,000.—Before the League of Nations was in effect Archduke Frederick of Austria was loaned money by an American syndicate in return for shares in his estate. Now with the League treaties in effect the nations in which the property lies claim he cannot divide with the claimants.

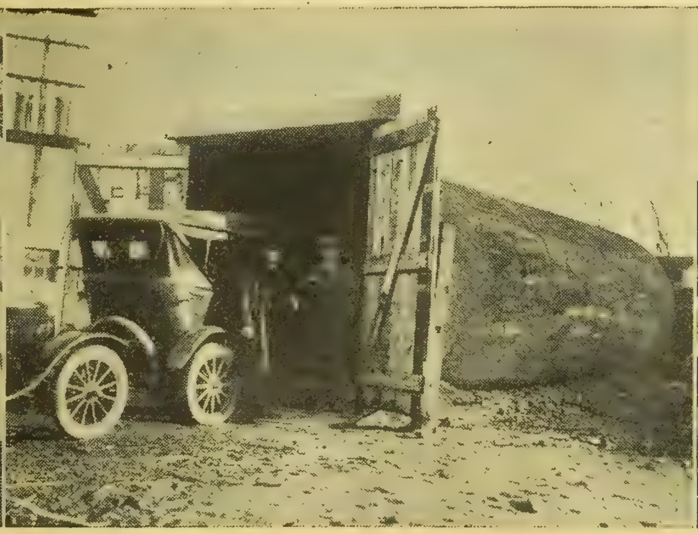
WALKING 1200 MILES PUSHING WHEEL BARROW TO WIN WAGER.—Joseph Crosta, of Bangor, Pennsylvania, World War Veteran, who has made a wager that he can push a wheel barrow with 100 pounds aboard from his home to Boston, Massachusetts and back in 40 days for a wager of $1,000. He is handcuffed to the barrow, but quite optimistic, as he made Boston in 16 days and is now on his return trip. The photo shows him leaving Boston.



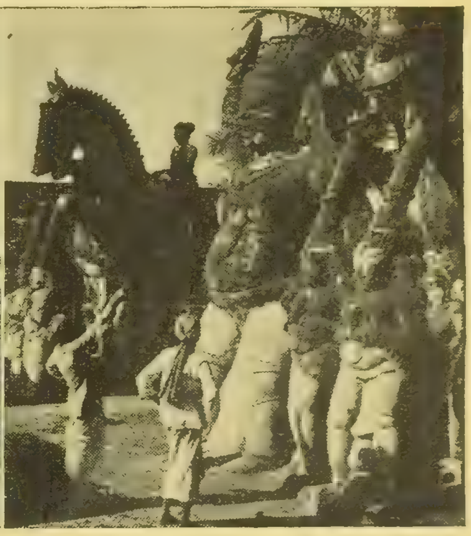
DEFEATS CRIQUI IN EIGHT ROUNDS.—Danny Frush, of Cleveland, Ohio, is here seen boxing in his gym at Paris, just before his bout with Eugene Criqui whom he knocked out in eight rounds of a 20 round bout. Criqui claims he is now through with the squared circle forever, pointing out that an ex-champion should never try to come back.



PERPETUAL MACHINE.—Richard Ulram of Jersey City, N. J., and his perpetual machine, which he claims is "right in principle, but wrong mechanically". He claims his mother appeared in a dream to him 17 years ago and told him he was to be the inventor of the perpetual machine.



OLD BATTLESHIP FUNNEL MAKES FINE GARAGE.—W. B. Fortune of Philadelphia, Pa., wanted a garage for his two cars and was wondering about what kind to build when a novel idea came to him. He went down to the navy yard and got a dismembered funnel of the scrapped USS Maine, and this is how his garage looked after he got through with it. It holds his two cars very comfortably.



TO THE INDIAN GOD.—Here is a very interesting photo, taken near Madura, India, showing the gigantic figures erected to the Indian God, Iyannar, one of the many household Dieties of the old Buddhist religion. Notice how each front foot of the horses is placed on the head of a figure of a native.

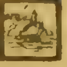
Current Agricultural News



MILK PRODUCERS MEET AT M. A. C. AUGUST 22

ONE of the largest midsummer picnics to be staged in Central Michigan is slated for M. A. C. August 22. On that date between 5,000 and 6,000 members of the Michigan Milk Producers Association will foregather for the annual summer outing and program.

N. B. Hull, president of the association, estimates that 25 per cent of the membership will attend and the organization has now a total of 20,000 members. The program for the day is now being planned by the picnic promoters.

Mr. Hull has invited Judge John D. Miller, of New York, president of the national federation of milk producers, to participate, and has extended an invitation to J. A. Glover, of Wisconsin, editor and dairyman, to speak. It is probable that these men, who will confine themselves to major dairy problems, legislative and otherwise, will be the principal speakers.

Arrangements are being made at M. A. C. to care for the crowd. Special parking accommodations will be extended and places for the picnic dinners and speaking program will be provided. Weather will make little difference in the program.

TO URGE CUT IN SUGAR TARRIFF

BEFORE you read this three of the members of the Tariff Commission will submit a report to President Coolidge urging a reduction of 25 per cent in the duty on sugar. These three members will take the position that the duties of the Fordney-McCumber Tariff law constitute an unjust burden upon the American people.

A duty of about 1.35 per cents per pound will be recommended by these three members, it is understood. The present rate on Cuban sugar, after allowing for the 20 per cent preferential rate applying on all imports from Cuba, is 1.76 cents a pound. The emergency tariff rate was 1.6 cents and the former Underwood law rate was one cent.

The sugar investigation has been the most important proceeding before the Tariff Commission since the enactment of the flexible tariff law in September, 1922. As investigation of sugar duties was ordered in November, 1922, and it has been in progress for about a year and a half.

The investigation was ordered on the basis of an application for a decrease in duty filed by Americans with sugar interests in Cuba. The proposed decrease in duty has been vigorously opposed by western beet growers, both of whom have insisted that the Fordney-McCumber rate is not high enough and that if the duty is cut materially it will mean the eventual destruction of the domestic industry.

ABOUT 250 ATTEND STATE HOLSTEIN ROUND-UP

THE annual "Round-up" of the State Holstein Ass'n was held at the Detroit Creamery Farms, near Mt. Clemens, under the joint auspices of the Macomb County Holstein Ass'n, the State Holstein Ass'n and the Detroit Creamery Company Farms on July 1st and around 250 were in attendance. Nearly every county in the state was represented and Macomb breeders—Holstein or otherwise—turned out in fine style.

All brought their dinners and ate them in the picnic grove at the Farms. They then gathered at the barns where one of the barns had been made into a improved moving picture theater and shortly after one o'clock the crowd was shown the latest educational moving picture issued by the U. S. Department of Agriculture on eradication of bovine tuberculosis. After the movie the well known "Jimmie" Hayes, chairman of the meeting, introduced the speakers of the afternoon in his usual humorous way.

The first one to address the meeting was D. D. Atkins, of Holstein fame, and he gave a very good talk, pointing out how the man on the soil is much better off than the city man. The next speaker was Mr. Long of the National Holstein Ass'n and during his brief talk he gave the crowd much information for them to think about. The last speaker was O. E. Reed, Professor of Dairy Husbandry, Michigan Agricultural College and he briefly told what his department of the college is trying to do. Few of our farmers know their agricultural college and what it is doing as they should.

Many others from the college staff were there but time would not permit the calling on them for talks so the meeting adjourned to the spacious lawn between the house and the barns where Bob Haeger, national Holstein judge, told them how to "pick the good ones." He worked on cows, bulls and calves answering all questions and the crowd kept him so busy that it was 6 o'clock before the round-up broke up. Every one went home tired, and the larger percentage was much wiser.

FARM RETURNS BETTER IN 1923

AN average cash balance of $890 was returned to owner-operators in 1923 on 16,183 farms surveyed by the United States Department of Agriculture. In addition to this margin of cash receipts over cash expenses these farms increased inventories of crops, livestock, machinery and supplies $130, making an average return of $1,020 for the use of $17,490 of capital and the labor of the farmer and his family. These farms also produced food and fuel consumed on the farm estimated to be worth $250 on the average.

This is slightly better than shown by a similar survey for 1922 on 6,094 owner-operator farms which averaged a cash balance of $175, increased inventory of $202, and produced food and fuel worth $294 on capital amounting to $16,410.

The cash balance of $890 in 1923 was all the average of these farms made available to the owner to pay his living expenses, take care of debts, and make improvements. Interest paid on debts during the year 1923 averaged $230 and the reported outlay for improvements averaged $140.

Sales of crops in 1923 on the average totalled $850 or 38 per cent of total cash receipts of $2,240. Sales of livestock or livestock products were $1,310 or 58 per cent of the total receipts. Miscellaneous receipts were $80.

Cash expenses amounted to $1,350, which included hired labor worth $350 for the year, livestock $240, feed $210, fertilizer $60, seed $40, taxes $190, machinery $110, and miscellaneous $150.

The size of the farms was 300 acres on the average and the reported value of land and buildings was $14,530, the size and value of the farms being larger than the average reported in the 1920 census. The value of crops, livestock, machinery and supplies on hand at the beginning of the year was $2,960. The average of the farms reporting in 1922 was 252 acres and the average capital $16,410.

The department points out that the figures apply only to the farms reporting and to the farm business in each year. Many farmers have property besides the farms they work, or supplement their farm returns with outside work, and many draw on savings or borrowed to meet expenses not covered by current receipts. It is probable, however, that the figures give a fairly accurate picture of the state of the business of owner operators in the years covered by the surveys, the department says.

MISSOURI FARMERS FAVOR CO-OPERATIVE MARKETING

ACCORDING to the Missouri State Marketing Bureau, Jefferson City, the work of signing up farmers to the "Producers' Contract" fostered by the Missouri Farmers' Association is going forward steadily and with satisfactory results. The contract provides for the marketing of livestock, grain, and dairy and poultry products for a period of five years.

The association is organized under the non-profit cooperative marketing act passed by the Missouri Legislature in 1923. It is estimated that nearly 20,000 producers in ten different counties have signed the contract. It is probable that no attempt will be made to put the contract into effect until at least 50,000 producers have signed up, for the association is now handling the above products of approximately 70,000 farmers without a contract. Three-fourths of the farmers in a given trade territory or county must be signed up before the contract can become effective as to that county or trade territory. Without a contract, the Association is reported to be the largest individual shipper of eggs in the country. It also maintains the largest cooperative livestock commission company on the East St. Louis livestock market. Butterfat is sold by the 400 local exchanges direct to the centralizers or creameries. A recently established grain commission company at St. Louis is expected to handle in the near future the volume of grain of the members of the farmers' Association.

OLD TIMER'S SCYTHE CONTEST AT M. A. C.

ON Friday, Aug. 1, the Michigan Agricultural College at East Lansing, will act as host to thousands of Michigan farmers, their wives and children, and others who are interested in agricultural progress. The beautiful 105-acre campus furnishes excellent facilities for such an occasion.

One of the features of the day will be a hay-making demonstration on a 25-acre field of alfalfa, which will chow in operation the best and cheapest methods of making hay with modern hay-making machinery. This feature will also include an old timer's scythe contest, which is open to the pioneer farmers of Michigan, who used this method in their younger days. The afternoon program will start off with a parade of the college live stock equipment, which includes many outstanding individuals of the representative types and breeds. Acting President R. S. Shaw, dean and director of the experiment station, will act as chairman of the day.

Uncle Rube Spinach Says:

WATCH OUT FOR SPOTLIGHTS!

NOW 'at the nominatin' season has sprung onto us there's a lot of things to watch out for. Somebody's goin' to be nom'nated an' without any doubt somebody'll be 'lected—not only for pres-dent but for congress an' our state legislature. Conventions 'll be in order now for a long time—'bout two or three months. Primaries 'll be held that don't amount to much—a primary election is only jest a farce anyway an' a bill of expense. Nobody voted for in the pres'dential primary is hardly ever nominated for pres'dent. Lots of fellers voted for in congressional primaries or other wise never get to be congressmen.

Folks, if we want wise laws don't it kinda stand to reason that we've got to 'lect wise men to make 'em for us? You know there's lots of men ready to take the job 'at don't know hardly enough to run their own affairs. I could mention numerous ones an' mebbe more includin' one whom modesty prevents me from mentionin'—but we have some nice honest men—every state has 'em—'at would make good congressmen—men 'thout a spot all onto 'em—'thout any spot a' tall. But do we git such men? Well do we? Oh its a great thing to be a senator—worth lots of money, a quarter of a million to some—it's a great honor to be 'lected to congress, to be public servants of the people. They may be real honest before 'lection but do they stay honest afterwards? Don't they git kinda spotted up with oil an' sim'lar an' any thing 'at has money into it for them.

Do they always come back home the same unspotted men they wuz when we sent them away with high hopes an' lots of faith in their future actions?

Well in the last few weks I've changed my mind 'bout runnin' for any kind of office. I'm none to honest now—I try to git along without act-ly stealin' but the temptation comes now an' then to do it so I'm just livin' my plain life an' hankerin' for no particular political job. I have kinda always belonged to either the Democrat or Republican party with a strong leanin' either way. An' yet I am not neutral if you get my meanin', its got to be one or the other or both—just like Lafolette is an' others that have busted the party they claimed to be one of.

Now Mr. Coolidge is all right with me—he's quit an' ain't doin' me no harm—I wasn't in the war nor am I a mail carrier, Mr. Davis an' I always have been good friends—he's never seen me an' vice versa, so as to speak. Mr. Mc Adoo, Mr. Smith, Underwood, are all the same to me—all good men in their own place—which mebbe is their own little homes. No matter friends, somebody's goin' to be 'lected for our own state legislature—yes, an' we 'lect a gov'nor too—what'll it be? A Republican an' sinners or a democrat an' what? I'm kinda in favor of 'lectin' a real he-man for all the offices—state an' county—pres'dent an' all. Now what do you say? Remember I am not runnin' for any office—course I'd like to be gov-nor or somethin' but I'm not sayin' anything, just leavin' that to my friends—if I have any. But any way it depends jest on us who'll be who when 'lectin's over next November.—Cordially yours, UNCLE RUBE.

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

MUST GO TO SCHOOL AFTER SEVENTH BIRTHDAY

In a case of this kind what can a person do? We live over two miles from our school district on a state trunk line. At what age must I send my boys to school? There is another district school a little over a mile in an opposite direction from our own district. Is there any way that we can be set over in the other district so we will not have to pay tuition? What is the school law on sending small children over two miles?—B. C. S., Ada, Mich.

CHILDREN must be sent to school after their seventh birthday. The fact that the family lives on a trunk line and is over two miles from school does not have a legal bearing on the case. If the distance is over two and one-half miles children under nine years of age would not be compelled by compulsory attendance law to attend school unless transportation is furnished.

The township board has authority to detach property from one district and attach it to the district the schoolhouse of which is nearer. The first step of the procedure for such is a petition.—G. N. Otwell, Supt. Rural Education, Dept. of Public Instructions.

SHOULD GIVE NEW WARRANTY DEED

About two years ago I sold a farm, giving a warranty deed subject to a mortgage, and with other exceptions. A short time ago I received a letter from the bank through which I made the sale, stating that the party who purchased the farm had lost or mislaid the deed. And the bank inclosed a quit claim deed asking me to acknowledge it and return it to them. After filling in the regular quit claim deed the banker added a clause something like this: "This deed is given on account of warranty deed given by myself and wife having been lost before recording same." He made no mention of any exceptions in the warranty deed. Now what I would like to ask is this:

Would I be compromising myself in any way in signing this quit claim deed with this clause attached? Wouldn't I really be acknowledging giving a warranty deed without exceptions?—C. P., Matherton, Mich.

YOU should give a new warranty deed and include in it all the exceptions and reservations contained in the old one and state that the new deed is to take the place of the old one which becomes void upon the execution of the second. Do not give a quit claim deed without including the exceptions which are contained in the original deed.—Asst. Legal Editor.

MUST CALL REGULAR SCHOOL MEETING

I would like to ask a few questions about our school district which seems to be run in a "Slip Shod" manner. Could the school board decide not to call a regular annual school meeting as prescribed by law without due notice? The school board held a meeting in the afternoon before the regular annual meeting, and decided to hold it, the annual meeting, at a later date. Would such be legal, when it was held without further notice? How should school officers be elected? The director had the wood cut off his woodlot. The moderator hauled the wood to the school from director's woodlot. Would the assessor have right to pay moderator for said wood, if notified by a tax payer not to do so?—G. W., Empire, Mich.

THE school board has no authority to decide not to call a regular annual school meeting. If no annual meeting is held on the day prescriber in the law, it cannot be held until the time for the next annual meeting. At each annual meeting one or more school officers are to be elected. If there is no annual meeting the township board appoints some person to fill the vacancy after twenty days from the annual meeting have expired.

The officers of the district have no legal right whatever to sell wood or other material to the school district, nor to work for the school district. Any such act performed makes the officer guilty of a misdemeanor and punishable by a fine or imprisonment or both. The treasurer should not pay an order for wood sold by another officer to the district.—W. L. Coffey, Deputy Superintendent of Public Instruction.

CONTINUES TO SEND PAPER

I subscribed for a weekly paper for one year in 1918. I paid in advance and they continue sending it. Do I have to pay for the time they have been sending it? Thanking you in advance, I am.—L. D., Holton, Mich.

IF you have directed them to stop sending the paper, I am of the opinion you would not have to pay for issues sent you after instructing them to discontinue sending it.—Asst. Legal Editor.

TROUBLE WITH TRESPASSERS

I am having trouble with people trespassing on farm. I have signs up but they do not seem to pay much attention to them. I live near a government lake, but there has not been a right of way made public. They say we have no right to stop them as it is a government lake. But the government has not given a right of way. The road is about 10 rods from lake front and they park on side road in front of house. Have they right to do so? They open gate, drive in with auto and have fish houses on and unload, never ask permission. Hoping you can give me some advice, I am—G. S., Kalamazoo, Mich.

IF you own the property, you would have exclusive right of possession up to the edge of the lake, and unless there has been a public right of way established no person would have the right to go on the land without your permission. I suggest you see the local prosecuting attorney in regard to this matter.—Asst. Legal Editor.

MUST GO TO SCHOOL UNTIL 16 YEARS OLD

Would you please tell me if there is a law passed in Michigan that compells a boy to go to school until he has passed the eighth grade.—W. G., Bay County, Mich.

BOTH boys and girls are required by the compulsory education law to attend school until they are sixteen years of age unless excused under the provision of the law. This is true even though they have passed the eighth grade unless they are living in a district which does not have grades beyond the eighth grade.—W. L. Coffey, Deputy Superintendent of Public Instruction.

WANTS TO ADOPT CHILDREN

I am a reader of the M. B. F. and its O. K. and I don't like to wait two weeks for the next issue. I have two orphans I took for adoption if they proved satisfactory after six months trial. Then I got in touch with their guardian (their father) and he wrote a very satisfactory answer. I have written him ever so many times since then but no reply. The last letter with his consent was dated July 25, 1922. Isn't there a way to arrange so they will be mine legally and my heirs?—G. W. G., Evart, Mich.

I WOULD advise you to take this matter up with the local probate judge. He would have jurisdiction over such matters and will tell you just how to proceed.—Asst. Legal Editor.

COULD NOT CLAIM LAND

A and B own adjoining land. A 15 acres and B 11 acres. A sells 10 of his 15 acres and moves away. B removes line fence, works and pays taxes on A's remaining 5 acres for 40 years. Can B claim said 5 acres there being no agreement between A and B concerning said 5 acres? What is meant by claim of right?—I. H., Redford, Mich.

IF B entered into possession of the 5 acres without any claim of right or color of title, but on the contrary took possession knowing the land was A's and that he had no right to it, I am of the opinion he could not claim title by adverse possession.

To acquire title to land by adverse possession, it is essential that claimant have some grounds for claiming it as his own, and, having such grounds, continues to occupy the land for the statutory period of time, disputing the real owner's claim to it.—Asst. Legal Editor.

AUNT IS LIABLE

We are subscribers to the M. B. F. and come to ask for help. We sent a year ago for my aunt from Germany, as she wanted to come and she wrote to us that she would pay us every cent if we sent her the ticket. So we went and borrowed the money, $213.00, and we paid the interest for one year which was $12.78. The note was due the last of August and now she married and we have wrote to her several times but do not receive an answer. So please let us know what can be done, as we cannot afford to lose that money, as we have a large family and lots of debts on our farm yet.—Mrs. G. K., Sutton Bay, Mich.

YOUR aunt would be liable to you for the payment of the $213.00 expenses with interest, under her promise to do so. If she refuses to pay you this amount, you could bring suit against her to recover same.—Asst. Legal Editor.

CANNOT COLLECT FROM ESTATE FOR BOARD

Can an heir collect from an estate pay for board and care for parent, when no arrangements have been made to that effect? And board has not been paid by parent. Kindly answer through the columns of your valuable paper.—Mrs. A. R., Davison, Mich.

AN heir could not collect from the estate for services rendered the parent unless there was some understanding that such services were to be paid for.—Asst. Legal Editor.

EXEMPT $250

I sent some money to a bank in Minnesota given on a note without an endorser. How much stock and tools am I exempted from seizure?—Subscriber, Vassar, Mich.

ALL your stock and tools up to the value of $250.00 would be exempt from seizure on execution for your debts.—Asst. Legal Editor.

U. P. Farmers Stock Up on Pure-Breds

By L. D. TUCKER

THE Cloverland Dairy Special is history—as far as the train itself is concerned. The dairy demonstration train, organized June 2nd, under the joint co-operation of the five railroads operating in the upper peninsula of Michigan, the Michigan Agricultural College, the Upper Peninsula Development Bureau, the banks, and other agencies throughout the peninsula completed its itinerary of thirty-nine stops in upper Michigan, Saturday, June 21, at Wakefield, in Gogebic county. And thirty-seven pure-bred registered, pedigreed dairy sires were left behind as tangible evidence that the Cloverland Dairy Special was the most constructive development feature ever attempted in that section of the state.

Of the thirty-seven pure-breds placed at various points throughout the peninsula, twenty were Holsteins and seventeen Guernseys. The majority of the sales stock was purchased in Wisconsin, and carried along in two live-stock coaches one of the animals is of blooded stock, and were offerd to the farmers along the route at prices which would have been impossible in buying direct from the breeder, freight and other expenses considered.

During its three weeks of operation in upper Michigan, the Cloverland Dairy Special visited thrity-nine communities, and conducted as many dairy "booster meetings". The total attendance was about 4,000, the attendance at each meeting ranging from fifty to 500 farmers.

Rudyard, in Chippewa county, is credited with the most enthusiastic and largely attended meeting during the trip of the "dairy special." Seven pure-bred bulls were placed in Chippewa county, largely through the preliminary campaign carried out by D. L. McMillan, newly appointed county agricultural agent in that section. The farmers in and about Rudyard arranged a live-stock display for their own, on the occasion of the train's visit to that community, and here a decidedly interesting program of judging contests, talks and other features were held.

The prize "bid bull," consigned to the train from the pure-bred herd at the Newberry State Hospital, went to two Finnish farmers at Bruce's Crossing, who bid $211 for the animal. This bull was offered along the route to the highest bidder. The bids were sealed and opened upon the completion of the itinerary, with the above results. The second highest bid was $204, and the lowest bid $20. The animal was valued at $300 by the herdsman at the Newberry Hospital, on the strength of the production record shown by his dam, who produced 32 pounds of butter in a week during her test period—more than the best record of the dam of any other bull offered for sale from the "dairy special."

Questionaires calling for specific information relative to the attitude of the farmers of the upper peninsula on pure-bred sires were distributed along the route, and a great number of these were filled out and returned to those in charge of the train. The cards will be used as a basis for further effort along better-dairying lines. In addition, a considerable quantity of better sire literature was placed throughout the entire district.

Representatives of all the railroads in the peninsula; of the various state and national breeding associations; of the press and of the agricultural schools throughout the district accompanied the train on its trip through upper Michigan.

The Cloverland Dairy Special was, without reservation, an unqualified success, and it should contribute materially to the growth and progress of upper Michigan's dairying industry.

This photo of the Cloverland Dairy Special was snapped at one of the many stops made and gives an idea of the interested crowd that gathered at nearly every stop. The farmers meant business and they got some high grade bulls at very low prices.

What the Neighbors Say

SELECT OFFICIALS WITH CARE

DEAR Editor:—Keep the waste basket full. Do not feel discouraged when your writings do not immediately appear, for the Editor must have plenty to choose from. This is a gloowy season of the year for the farm tax-payer and writing his feelings, and planning reform in business and politics will in a measure, drive that gloom away. One or two of the largest items on the tax receipt of this district, is a special tax for benefit caused by the action of sate officials, under the Covert Road Act, and the other by the action of a county official not a constitutional officer acting under the drain act of 1915, as amended.

The actions of both those officials were prompted by the petition of non-resident owners, several petitioners not being electors of this state. Such proceedings as these legalized by acts of our legislature leads us to believe that the remedy for such injustice lies in a longer and more explicit constitution. Agricultural lands are soon to be depopulated if the tax laying farm mortgaging is to be longer delegated to others than the parties who have bought the land under a different rate of taxation, with no better way of earning the taxes.

It is an undisputed fact that it costs more to transport a ton per mile today than it did 35 years ago, notwithstanding that we have almost sunk our farms under debts for improved roads and costly bridges. Since our export trade in staples has fell away, we are helpless as any protective tarrif measure has the tendency to increase acreage in the crop protected thereby defeating the wished hoped for benefit by further discouraging export and import trade. It would seem that the most practical means at hand which is left for us to use, is to begin locally to exercise economy in local affairs, to-wit: We have now on the status books a new drain law which is an uncertain quantity as yet, but one feature of the law can be governed locally by the electors of the township electing to office supervisors and highway commissioners who are known to favor less public work in the line of county drains as under the amended law all county drain projects must be passed upon by the three supervisors appointed by the judge of probate and if the farmers will forget the past and select a supervisor they feel sure of, for the future the probate court will have a body to select from that will do justice to those who are working for mere necessity, instead of speculative enterprises. The highway commissioners also need careful election. The electors of a township should try and get from their auditors a concise statement of township affairs before town meetings, for, from year to year it seems we keep on gazing at the wall after the nominations have been made, and never taking a firm step forward in such matters. —Ernest Richardson, Huron County, Michigan.

WANTS TO EXCHANGE IDEAS

TO the Editor:—I would like to exchange ideas with other farmers through your valuable paper with regard to the condition and chance for improving their standing and placing them on a nearer equal footing with those who are engaged in other kinds of occupations.

In the first place I believe it would be advisable to make an effort to get a bill passed; something similar to the bill proposing that the navy be instructed to handle farm productions in this and foreign countries under certain regulations included in the bill so that farm products will reach the consumers both in this and foreign countries at the least possible expense through government control.

Such a management properly arranged and conducted I fully believe would be of more benefit to the farmers than anything that has been accomplished for their benefit from the beginning of time up to the present.

The two old parties have promised and promised but what have they done except to help the farmer get deeper and deeper in debt by placing the great burden of taxation and high freight rates on his head to bear him down and make his condition still worse. What else have they done? Recommended the high in price. President Coolidge called his cabinet together and those brainy men after careful, solemn and deliberate consideration on some method of assisting the farmers out of their straightened circumstances, finally concluded to advise the farmers to raise more beets, result—sugar came down but not yet on account of farmers raising more beets but when the farmers do raise more beets in large quantities, beets will come down. Every farmer's boy twelve years old or more understands now that an increase of production has a tendency to decrease the price and decrease of production has a tendency to increase the price; then what did the government advise you to increase the production of beans and beets? To improve the farmers' condition or the consumers'? The Germans used camouflage during the war but each of the old parties have got our votes through promises, but what have they done? I will leave that matter for you to decide.

Like Bryan, I respected Coolidge and Dawes as being very competent and capable men yet their mental training and ideas don't seem to coincide with our best interests. They wanted farmers to raise more beans when beans were high. The farmers being loyal raised more beans—result, price went down. Consumers benefited. Farmers went back at work at the same low price for all commodities. Last fall sugar was seem to be trained and educated in the other fellows' school. Their sympathies judging from their works don't seem to have any leaning towards the farmers consequently the farmers votes should never help elect them or any of the reactionary Republicans or Democrates.

I also, like Bryan, believe that it would be almost impossible to drive a razor blade between the Republican Reactionaries and Wall Street with a sledge hammer and I might include the reactionary Democrates as far as the farmers are concerned. Those who comprise the Farm Bloc and Progressives of either party are the only ones the farmers should support until their business lands on an equality with other occupations.

The burdens and downward pressure that has been and is now being placed upon the farmers will eventually bring about a revolution —in politics at least.

No country ever prospered any great length of time whose farmers were continually oppressed. It is quite a true saying when the farmers of a country prosper the country prospers.

In conclusion would say to the farmers of this country the time has fully come when you should study earnestly and pick out such men from each part for public offices, whom you have good reason to believe are avowedly in favor of the farmers' interest and the general good of the whole country to the end that farms, bonds, and all properties, shall be taxed equitably and on a just and fair bases.—M. S. Howes, Ingham County.

POWELL AND BENNETT DESERVE THANKS

DEAR Editor:—Stanley M. Powell and Frank W. Bennett deserve our thanks for real service. The logic of Mr. Bennett's article in the April 26th issue points clearly to efficient organization, not only to produce and market economically, but also to regulate production and control prices. Unless we can get fair prices we can not afford to produce, and we can't get fair prices if we produce too much.

But what about anti-trust laws? Well, what have they ever accomplished? The simple fact is that the every-man-for-himself-and-devil-take-the-hindmost industrial system we call "competitive" is not only un-Christian and un-American, but unpractical as well. Ability to insure fair prices is as essential to the prosperity of other industries as to ours, and the only way to do it is to control production. Where is the sense in wasting human energy by producing more wheat and potatoes than human bellies can hold when human backs lack clothes? And if machinery enables us to produce an excess of all commodities, why not give every worker a little leisure instead of working half of them to death while the rest hunt for jobs? The trouble is each industrial group is too intent on its own problems to lift its eyes and consider industry as a whole. Industrial cooperation is necessary, but inter-industrial cooperation is equally important.

Just now, however, I want to talk a little more about taxes. My letter in the April 12th issue "No Exemptions" and secrecy for income records. But what good reason is there for such secrecy any more than with property valuation records?

As for exemptions, to assess corporations on their full net income would be unfair because it would be double taxation and because the large income of the corporation would pay higher rates than the smaller personal incomes of small stockholders. Not to assess corporation incomes at all would give non-resident stockholders an unfair advantage and deprive the state of considerable revenue. Let corporations, then, be assessed only on that portion of their net income paid out in dividends to non-resident stockholders, which would otherwise pay no Michigan tax. Untaxed surplus should, of course, be limited to some reasonable relation to the size of the business and stock dividends treated as part of the personal income of stockholders.

In figuring net personal incomes no account should be taken of rental value of homes, and renters should deduct house rent actually paid. National income taxes should also be deducted before assessing for state taxes. Let all incomes be declared too, and all taxes assessed and collected by local treasurers. Let each net income be divided into thousand dollar sections. Let the first section pay as low a rate as may be. Let the second pay perhaps five mills on the dollar more, and increase the rate progressively for each succeeding section, provided that no section of any income shall pay more than fifty per cent.

But don't put all these details into the constitution. In my opinion the amendment now being presented is fatally defective at this point, besides being open to serious criticism in other respects. Simply authorize the abolition of property taxes and the raising of all public revenues by graduated or progressive income and inheritance taxes. Then elect the right kind of a legislature, leaving it free to fill in details and revise them occasionally in the light of experience.—Stacy Brown, Lake Odessa, Michigan.

CHANGE THE LAWS

MY dear Editor:—I was much interested in "What the Neighbors Say" in the issue of May 10th especially the article on prohibition enforcement by P. E. T. and also C. K., Muskegon, Mich., on war. Relative to the former in commenting on editorial "Prohibition On Trial" I am with the editor and more so for prohibition is not now a success after a fair trial. As to "increasing the fines" being the remedy I do not believe it is as that would only increase the prison population, our third heaviest public expense. Regarding "probation" as being a failure, it has not been proven in this county (Huron) although much used as records will show.

When P. E. T. mentions the United States I presume the elector means that the constitution of Michigan and incidentally the Judicature Act be amended to deal with this particular breach of law which would be at least "a large order", considering the many amendments defeated by the electors since 1909. The writer has for years favored a longer constitution and shorter ballot for both the state and nation, but to put such a measure through is very difficult in time of peace.

Though we champion the principle of "State Rights" claim that the habits of our people aided by modern invention and chemistry makes the states right doctrine of Jefferson's time a dead doctrine, especially when it attempts to control the habits of "The Person" in love and pleasure "conviviallity."

The trouble with the prohibition law, state and national, is the per cent of poison mentioned in the act is unreasonably low as no good house-wife can prepare the food for the family as she has been used to doing it without breaking the law. This makes the law a dead letter and the inventive genius of the people take account of this and enlarge upon it until finally a search warrant is sworn to and another erstwhile good family disgraced by the police, all because the state and nation made no provision for the sale of poison to responsible persons. The remedy is to amend basic law making provision for the sale on state account by persons under bond; and while at the job better include narcotics, explosives and a registry and mark on all fire-arms. Put the bootlegger out of business by competition and the Canadian rummer will go with him.

As to the article by C. K. on war prevention would add an amendment to "popular vote" spoken of by requiring the registered male electors between the ages of 21 and 45 to do all the voting as to declaring war which had for its object the invasion of foreign lands not contigious to U. S.—E. R., Port Hope, Alien born, age 56, still hopeful.

FARM MECHANICS

COST OF OPERATING AN AUTOMOBILE

IT must be because the motorist buys gasoline oftener than anything else connected with his car that the price irks him so much. If he ever sat down and figured the relative cost of gasoline and the other charges for the operation of a car during a year he would be very much astonished to find that gasoline amounts to only about fifteen per cent of what he spends for the pleasure and profit of owning and operating an automobile.

He invests on an average, it has been computed, $900 in a car which should ordinarily be good for six year's service. Say that at the end of the six years he has nothing left of his investment but a piece of junk. That would mean ownership of the car had cost him $150 a year for depreciation. Allow him six per cent interest on the $900 he paid for the car and it will run to $54 a year. Say he has to buy a tire each year at $30. He pays $5 a month for a garage on an average, many paying $10 a month but many, in the country, running the car into a barn or letting it sit out.

Allow $75 a year for repairs, which would be, in six years, equal to one half of the original cost. Put down at least $18 for insurance against fire and theft. License plate and taxes on the original purchase or on parts will run about $25 a year. Calculate a gallon of gasoline a day—or at the very lowest, ten miles driving—at twenty-one cents a gallon and it costs $78 a year. Figure a quart of oil, at twenty-five cents, to every 100 miles, a generous allowance, and say it costs $10 for $5,000 miles a year.

The annual cost will then appear as follows:

Depreciation	$150	30.0%
Interest	45	10.8
Tires	30	6.0
Garage	60	12.0
Repairs	75	15.0
Insurance	18	3.6
License and Taxes	25	5.0
Gasoline	78	15.6
Oil	10	2.0
Total	$500	100.0

Gasoline thus costs but 15.6 per cent of the total upkeep of a car, or 15½ cents out of every dollar spent.

But a great majority of car owners buy a car and forget all about allowing for depreciation for wear and tear, or for interest.—Oil and Gas Journal.

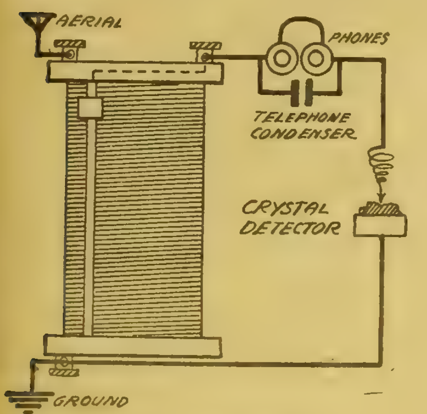
RADIO DEPARTMENT

EDITED BY J. HERBERT FERRIS, R. E.

A CRYSTAL RECEIVING SET

A SHORT time ago we told you the parts that you would need for building a crystal receiving set. Such a set can be used by those of our readers who live within 30 miles of a broadcasting station. Fortunately there are many of you who can use such a set and hear all the good things that are on the air at a very small initial expense.

The connections of both a one slide and a two slide tuner are shown in the diagrams herewith. You should connect your set as shown and you can with a very little practice succeed in hearing the nearer station loudly on telephones and exceptionally clearly, as a crystal will bring in both voice and music clearer and truer than a vacuum tube. Later on you can add a vacuum tube amplifier at a small additional expense.

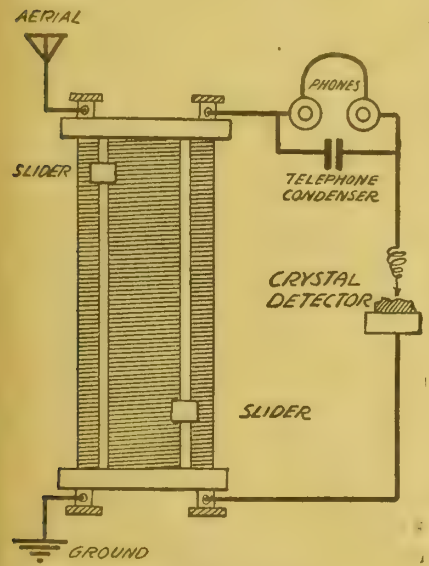


One slide tuner.

It is necessary that you use telephones of high resistance, these should be the regular radio receiving telephones of about 2,000 ohms resistance. On some sets an ordinary 75 ohm telephone costing around one dollar will give fair results but the better phones are much to be preferred.

Under no circumstances must you drop your phones, as a sudden jar will make then lose part of their magnetism and so decrease their sensitivity. The surface should not be touched with your fingers as the natural oil of your body will coat it so that it will be hard to find a sensitive spot.

After connecting up your set, place a small piece of crystal, about the size of a bean, in the crpstal holder, fastening it securely so that it cannot move. For crystals, Galena, Silicon or Radiocite will prove as satisfactory as any, silicon apparently having more spots that are "sensitive" than the others.



Two slide tuner.

Having placed your phones on your head, the aerial and ground connections having been made, carefully adjust the "cat's whisker" contact (the "cat's whisker" is the small wire on the crystal detector stand that is used to make a contact with the crystal) so that there is a light contact with the crystal, then move the slider or sliders on the coil up and down the length of the coil slowly until you hear the broadcasting. At times the cat's whisker will not be on a sensitive spot, so then you will have to shift it to a new spot on the crystal and keep shifting it a little at a time till you find a sensitive spot.

In the summer time when there is so much "static" or atmospheric electricity you will be able to hear a slight crackling sound in your telephone receivers which will enable you to tell when you have found a sensitive spot.

After finding your broadcasting station, shift your slider, a turn of wire at a time, 'till you get the music or voice the clearest and loudest. At this point you should be able to hear the station any time that you wish to listen to them. By placing a small mark for each station that you hear you can go back to any station whenever you wish.

In the old days of wireless telegraphy your radio editor used a crystal set as his first set and thereby gained a lot of useful knowledge that was of advantage when he started in to use vacuum tube detectors.

Those who live near Detroit, Grand Rapids, Jackson or Lansing can buy many of these parts in the 5 and 10 cent stores. These parts will give you good results as well as some of the more expensive parts.

WITHIN A YEAR

A RADIO scientist writing in a recent issue of a radio magazine forecasts that within a year developments in radio may be expected to cover the following twelve points:

1. Relay broadcasting will be developed so that the same program can be broadcasted simultaneously on this continent and Europe.

2. A system will be adopted by which inter-denominational religious services will be broadcasted to the whole country every Sunday.

3. A radio record will be perfected so that programs can be received automatically all day—and run off later when desired.

4. The first broadcasting of pictures by radio television on a commercial basis may occur, and a "picture receiver" simple enough to be built by amateurs may be announced.

5. A new circuit that eliminates static great sensitivity will be produced.

6. Amateur transmission will be carried on more and more on the short waves, and long distance transmission will be attained on from 20 to 50 meters.

7. Apparatus for the production of directed beams of radio waves will be announced for the use of amateurs as well as for the purpose of relaying broadcast programs.

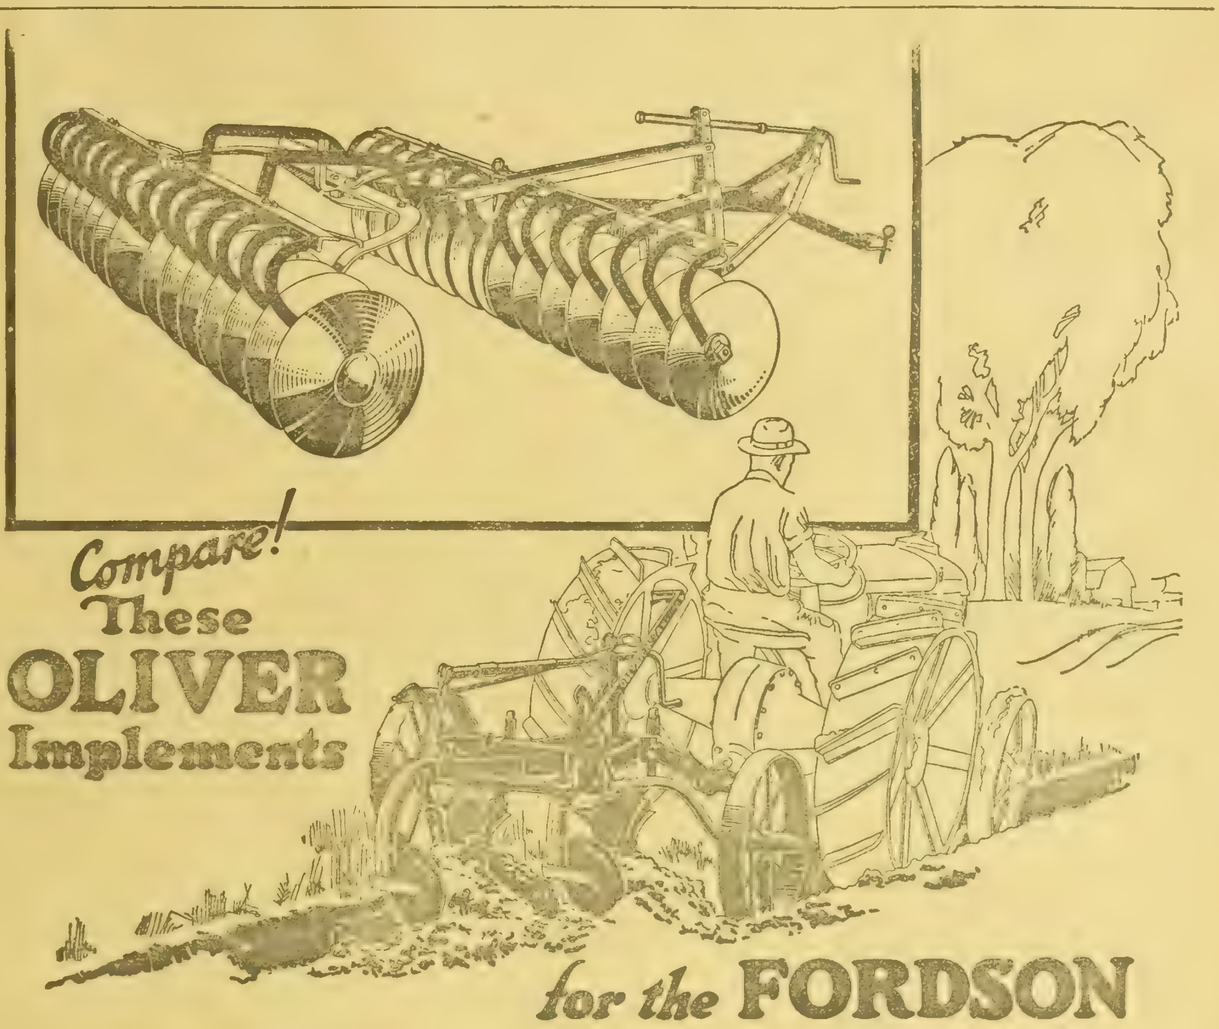
8. The waves sent out from living nerves will be detected by radio apparatus—thus opening up a whole new field of scientific work in physiology and psychology.

9. The theory of the crystal detector will be discovered and new crystals of great sensitivity will be produced.

10. Transoceanic amateur tests will be extended to Asia, Africa and South America.

11. Exploration of the upper air will yield new facts about the heaviside layer and a new theory of fad-

(Continued on Page 17)



Fordson power is the modern farm power.

Put behind it an Oliver No. 7-A plow or an Oliver FDH Disc Harrow and you are using the most modern outfit designed to help you toward bigger crop yields.

You will find the No. 7-A a pleasure to operate. Plowing depth is set by a powerful screw which will raise the bottoms completely out of the ground even with the outfit standing still. Each adjustment of the plow is conveniently made from the tractor seat. Of course there is a power lift.

Equally convenient to operate and capable of equally good work under varied soil conditions is the Oliver FDH harrow. Here, also, a quick acting screw control, operated from the seat, permits the gangs to be angled with the tractor moving or standing. The flexible construction permits short turns, gives lightest draft and even depth penetration.

Experience of three generations in the making of highest grade, practical farm implements, and in more recent years, close cooperation in the building of equipment for the Fordson, has made possible the development of these new Fordson tools.

See and compare their work with your own exacting standard of quality soil preparation.

Oh Money! Money!

by ELEANOR H. PORTER

Copyright by Houghton Mifflin Company

(Continued from July 5th Issue.)

AS the door shut crisply, Miss Maggie turned and looked at Mr. Smith. But Mr. Smith had crossed again to the stove and was fussing with the damper. Miss Maggie, after a moment's hesitation, turned and went out into the kitchen, without speaking.

Mr. Smith and Miss Maggie saw very little of Miss Flora after this for some time. But they heard a good deal about her. They heard of her generous gifts to families all over town.

A turkey was sent to every house on Mill Street, without exception, and so much candy given to the children that half of them were made ill, much to the distress of Miss Flora, who, it was said, promptly sent a physician to undo her work. The Dow family, hard-working and thrifty, and the Nolans, notorious for their laziness and shiftlessness, each received a hundred dollars outright. The Whalens, always with both hands metaphorically outstretched for alms, were loud in their praises of Miss Flora's great kindness of heart; but the Davies (Mrs. Jane Blaisdell's impecunions relatives) had very visible difficulty in making Miss Flora understand that gifts bestowed as she bestowed them were more welcome unmade.

Every day, from one quarter or another, came stories like these to the ears of Miss Maggie and Mr. Smith. But Miss Flora was seen very seldom. Then one day, about a month later, she appeared as before at the Duff cottage, breathless and agitated; only this time, plainly, she had been crying.

"Why, Flora, what in the world is the matter?" cried Miss Maggie, as she hurried her visitor into a comfortable chair and began to unfasten her wraps.

"I'll tell you in a minute. I came on purpose to tell you. But I want Mr. Smith, too. Oh, he ain't here, is he?" she lamented, with a disappointed glance toward the vacant chair by the table in the corner. I though maybe he could help me, some way. I won't go to Frank, or Jim. They've—they've said so many things. Oh, I did so hope Mr. Smith was here!"

"He is here, dear. He's in his room. He just came in. I'll call him," comforted Miss Maggie, taking off Miss Flora's veil and hat and smoothing back her hair. "But you don't want him to find you crying like this, Flora. What is it, dear?"

"Yes, yes, I know, but I'm not crying—I mean, I won't any more. And I'll tell you just as soon as you get Mr. Smith. It's only that I've been—so silly, I suppose. Please get Mr. Smith."

"All right, dear."

Miss Maggie, still with the disturbed frown between her eyebrows, summoned Mr. Smith. Then together they sat down to hear Miss Flora's story.

"It all started, of course, from—from that day I brought the letter here—from that man in Boston with seven children, you know."

"Yes, I remember," encouraged Miss Maggie.

"Well, I—I did quite a lot of things after that. I was so glad and happy to discover that I could do things for folks. It seemed to—to take away the wickedness of my having so much, you know; and so I gave food and money, oh lots of places here in town—everywhere, 'most, that I could find anybody that needed it."

"Yes, I know. We heard of the many kind things you did, dear." Miss Maggie had the air of one trying to soothe a grieved child.

"But they didn't turn out to be kind—all of 'em," quavered Miss Flora. "Some of 'em went wrong. I don't know why. I tried to do 'em all right!"

"Of course you did!"

"I know; but 'tain't those I came to talk about. It's the others—the letters."

"Letters?"

"Yes. I got 'em—lots of 'em—after the first one—the one you saw. First I got one, then another and another, till lately I've been getting 'em every day, 'most, and some days two or three at a time."

"And they all wanted—money, I suppose," observed Mr. Smith, "for their sick wives and children, I suppose."

"Oh, not for children always—though it was them a good deal. But it was for different things—and such a lot of them! I never knew there could be so many kinds of such things. And I was real pleased at first,—that I could help, you know, in so many places."

"Then you always sent it—the money?" asked Mr. Smith.

"Oh, yes. Why, I just had to, the way they wrote; and I wanted to, too. They wrote lovely letters, and real interesting ones, too. One man wanted a warm coat for his little girl, and he told me all about what hard times they'd had. Another wanted a brace for his poor little crippled boy, and he told me things. Why, I never s'posed folks could have such awful things, and live! One woman just wanted to borrow twenty dollars while she was so sick. She didn't ask me to give it to her. She wasn't a beggar. Don't you suppose I'd send her that money? Of course I would! And there was a poor blind man—he wanted to buy a Bible in raised letters; and of course I wouldn't refuse that! Some didn't beg; they just wanted to sell things. I bought a daimond ring to help put a boy through school, and a ruby pin of a man who needed the money for bread for his children. And there was—oh, there was lots of 'em—too many to tell."

"And all from Boston, I presume," murmured Mr. Smith.

"Oh, no,—why, yes, they were, too, most of 'em, when you come to think of it. But how did you know?"

"Oh, I—guessed it. But go on. You haven't finished."

"No, I haven't finished," moaned Miss Flora, almost crying again. "And now comes the worst of it. As I said, at first I liked it—all these letters—and I was glad to help. But they're coming so fast now I don't know what to do with 'em. And I never saw such a lot of things as they want—pensions and mortgages, and pianos, and educations, and wedding dresses, and clothes to be buried in, and—and there were so many, and—and so queer, some of 'em, that I began to be afraid maybe they weren't quite honest, all of 'em, and of course I can't send to such a lot as there are now, anyway, and I was getting so worried. Besides, I got another one of those awful proposals from those dreadful men that want to marry me. As if I didn't know that was for my money! Then to-day, this morning, I—I got the worst of all." From her bag she took an envelope and drew out a small picture of several children, cut apparently from a newspaper. "Look at that. Did you ever see that before?" she demanded.

Miss Maggie scrutinized the picture.

"Why, no,—yes, it's the one you brought us a month ago, isn't it?

Miss Flora's eyes flashed angrily.

"Indeed, it ain't! The one I showed you before is in my bureau drawer at home. But I got it out this morning, when this one came, and compared them; and they're just exactly alike—exactly!"

"Oh, he wrote again, then,—wants more money, I suppose," frowned Miss Maggie.

"No, he didn't. It ain't the same man. This man's name is Haley, and that one was Fay. But Mr. Haley says this is a picture of his children, and he says that the little girl in the corner is Katy, and she's deaf and dumb; but Mr. Fay said her name was Rosie, and that she was lame. And all the others—their name ain't the same, either, and there ain't any of 'em blind. And, of course, I know that—that one of those men is lying to me. Why, they cut them out of the same newspaper; they've got the same reading on the back! and I—I don't know what to believe now. And there are all those letters at home that I haven't answered yet; and they keep coming—why, I just dread to see the postman turn down our street. And one man—he wrote twice. I didn't like his first letter and didn't like it; and now he says if I don't send him the money he'll tell everybody everywhere what a stingy t-tight-wad I am. And another man said he'd come and take it if I didn't send it; and you know how afraid of burglars I am! Oh, what shall I do, what shall I do?" she begged piteously.

Mr. Smith said a sharp word behind his teeth.

"Do?" he cried then wrathfully. "First, don't you worry another bit, Miss Flora. Second, just hand those letters over to me—every one of them. I'll attend to 'em!"

"To you?" gasped Miss Flora. "But—how can you?"

"Oh, I'll be your secretary. Most rich people have to have secretaries, you know."

"But how'll you know how to answer my letters?" demanded Miss Flora dubiously. "Have you ever been—, secretary?"

"N-no not exactly a secretary. But—I've had some experience with similar letters," observed Mr. Smith dryly.

Miss Flora drew a long sigh.

Oh, dear! I wish you could. Do you think you can? I hoped maybe you could help me some way, but I never thought of that—your answering 'em, I mean. I supposed everybody had to answer their own letters. How'll you know what I want to say?"

Mr. Smith laughed a little.

"I shant be answering what you want to say—but what I want to say. In this case, Miss Flora, I may exceed the prerogatives of the ordinary secretary just a bit, you see. But you can count on one thing—I shant be spending any money for you."

"You won't send them anything, then?"

"Not a red cent."

Miss Flora looked distressed.

"But Mr. Smith, I want to send some of 'em something! I want to be kind and charitable."

"Of course you do, dear," spoke up Miss Maggie. "But you aren't being either kind or charitable to foster rascally fakes like that," pointing to the picture in Miss Flora's lap.

"Are they all fakes, then?"

"I'd stake my life on most of 'em," declared Mr. Smith. "They have all the earmarks of fakes, all right."

"But I was having a beautiful time giving until these horrid letters began to come."

"Flora, do you give because you like the sensation of giving, and of receiving thanks, or because you really want to help somebody?" asked Miss Maggie, a bit wearily..

"Why, Maggie Duff, I want to help people, of course," almost wept Miss Flora.

"Well, then, suppose you try and give so it will help them, then," said Miss Maggie. "One of the most risky things in the world, to my way of thinking, is a present of—cash. Don't you think so, Mr. Smith?"

"Er—ah—w-what? Y-yes, of course," stammered. Mr. Smith, growing suddenly, for some unapparent reason, very much confused. "Yes—yes, I do." As Mr. Smith finished speaking, he threw an oddly nervous glance into Miss Maggie's face.

But Miss Maggie had turned back to Miss Flora.

"There, dear," she admonished her, "now, you do just as Mr. Smith says. Just hand over your letters to him for a while, and forget all about them. He'll tell you how he answers them, of course. But you won't have to worry about them any more. Besides, they'll soon stop coming,—won't they, Mr. Smith?"

"I think they will. They'll dwindle to a few scattering ones, anyway,—after I've handled them for a while."

"Well, I should like that," sighed Miss Flora. "But—can't I give anything anywhere?" she besought plaintively.

"Of course you can!" cried Miss Maggie. "But I would investigate a little, first, dear. Wouldn't you, Mr. Smith? Don't you believe in investigation?"

Once again, before he answered, Mr. Smith threw a swiftly questioning glance into Miss Maggie's face.

"Yes, oh, yes; I believe in—investigation," he said then. "And now, Miss Flora," he added briskly, as Miss Flora reached for her wraps, "with you kind permission I'll walk home with you and have a look at—my new job secretarying."

CHAPTER XIX

Still Other Flies

It was when his duties of secretaryship to Miss Flora had dwindled to almost infinitesimal proportions that Mr. Smith wished suddenly that he were serving Miss Maggie in that capacity, so concerned was he over a letter that had come to Miss Maggie in that morning's mail.

He himself had taken it from the letter-carrier's hand and had placed it on Miss Maggie's little desk. Casually, as he did so, he had noticed that it bore a name he recognized as that of a Boston law firm; but he had given it no further thought until later, when, as he sat at his work in the living-room, he had heard Miss Maggie give a low cry and had looked up to find her staring at the letter in her hand, her face going from red to white and back to red again.

"Why, Miss Maggie, what is it?" he cried, springing to his feet.

As she turned toward him he saw that her eyes were full of tears.

"Why, it's a letter telling me—" She stopped abruptly, her eyes on his face.

"Yes, yes, tell me," he begged. "Why, you are—crying, dear!" Mr. Smith, plainly quite unaware of the caressing word he had used, came nearer, his face aglow with sympathy, his eyes very tender.

The red surged once more over Miss Maggie's face. She drew back a little, though manifestly with embarrassment, not displeasure.

"It's—nothing, really it's nothing," she stammered. "It's just a letter that—that surprised me."

"But it made you cry!"

"Oh, well, I—I cry easily sometimes." With hands that shook visibly, she folded the letter and tucked it into its envelope. Then with a carelessness that was a little too elaborate, she tossed it into her open desk. Very plainly, whatever she had meant to do in the first place, she did not now intend to disclose to Mr. Smith the contents of that letter.

"Miss Maggie, please tell me—was it bad news?"

"Bad? Why, of course not!" She laughed gayly.

Mr. Smith thought he detected a break very like a sob in the laugh.

"But maybe I could—help you," he pleaded.

She shook her head.

"You couldn't—indeed, you couldn't!"

"Miss Maggie, was it—money matters?"

He had his answer in the telltale color that flamed instantly into her face—but her lips said:—

"It was—nothing—I mean, it was nothing that need concern you." She hurried away then to the kitchen, and Mr. Smith was left alone to fume up and down the room and frown savagely at the offending envelope tiptilted against the ink bottle in Miss Maggie's desk, just as Miss Maggie's carefully careless hand had thrown it.

Miss Maggie had several more letters from the Boston law firm, and Mr. Smith knew it—though he never heard Miss Maggie cry out at any of the other ones. That they affected her deeply, however, he was certain. Her very evident efforts to lead him to think that they were of no consequence would convince him of their real importance to her if nothing else had done so. He watched her, therefore, covertly, fearfully, longing to help her, but not daring to offer his services.

That the affair had something to do with money matters he was sure. That she would not deny this naturally strengthened him in his belief. He came in time, therefore to formulate his own opinion: she had lost money—perhaps a good deal (for her), and she was too proud to let him or any one else know it.

He watched then all the more carefully to see if he could detect any new economies or new deprivations in her daily living. Then, because he could not discover any such, he worried all the more: if she had lost that money, she ought to economize, certainly. Could she be so foolish as to carry her desire for secrecy to so absurd a length as to live just exactly as before when she really could not afford it?

It was at about this time that Mr. Smith requested to have hot water brought to his room morning and night, for which service he insisted, in spite of Miss Maggie's remonstrances, on paying three dollars a week extra.

There came a strange man to call one day. He was a member of the Boston law firm. Mr. Smith found out that much, but no more. Miss Maggie was almost hysterical after his visit. She talked very fast and laughed a good deal at supper that night; yet her eyes were full of tears nearly all of the time, as Mr. Smith did not fail to percieve.

"And I suppose she thinks she's hiding it from me—that her heart is breaking!" muttered Mr. Smith savagely to himself, as he watched Miss Maggie's nervous efforts to avoid meeting his eyes. "I vow I'll have it out of her. I'll have it out—to-morrow!"

Mr. Smith did not "have it out" with Miss Maggie the following day, however. Something entirely outside of himself sent his thoughts into a new channel.

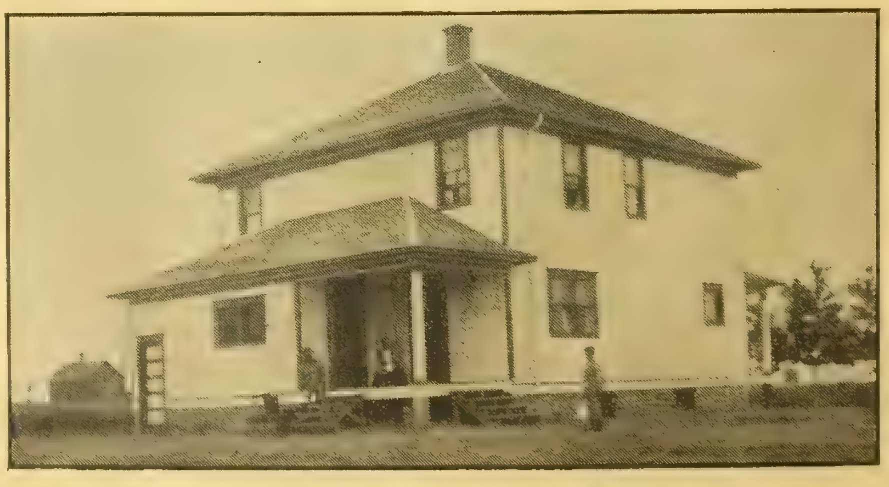
He was alone in the Duff living-room, and was idling over his work, at his table in the corner, when Mrs. Hattie Blaisdell opened the door and hurried in, wringing her hands. Her face was red and swolen from tears.

"Where's Maggie? I want Maggie! Isn't Maggie here?" she implored.

(Continued in next issue.)

OUR READERS' NEW BUILDINGS

Have you built any up-to-date farm buildings lately? If you have send us a picture of the new building and we will print it in this new department. It will show the M. B. F. readers what their distant neighbors are doing to change the scenery. And, incidently, you may be able to help some farmer decide the type of house, or barn, or other buildings he desires to put up. He may like the appearance of your building and will want the plan of it. Kodak pictures are all right if the details show up well. Do not send the negative, just a good print.



AT MAPLE LAWN FARM, COLEMAN, MICHIGAN.
This is a rear and side view of the new home of Mr. and Mrs. Ray Eagly at Coleman, Michigan. A good view of the front could not be taken on account of trees. It is 28 feet by 30 feet and consists of 10 rooms and basement. Mr. and Mrs. Eagly write "It was started in 1922 and completed and painted in 1923 and cost $2,400. We consider it a modern farm house. We are subscribers to The Business Farmer and have taken it since it was first printed on the pink sheet and like the paper fine." The name of their farm is Maple Lawn Farm.

THE LIFE THAT SUFFERS

A SERMON BY REV. DAVID F. WARNER

TEXT: "But he that endureth to the end, the same shall be saved."—Matthew 24:13.

YOU have read this scripture repeatedly. Just what is its purpose? Was it meant for dispensational theorists? Don't you think these mistake the Lord's intention? Certainly we shall be more sure of its meaning if we leave out the speculative element, and use the teaching as an incentive to right life and conduct. It is practical rather than theoretical.

The destruction of Jerusalem and the second coming of our Lord are the events predicted in the chapter from which our text is taken. One closes the Jewish dispensation and the other closes the age of Grace. One is a type and precursor of the other. Before each very trying times are to occur. We shall have to live in a world of wars, pestilences, earthquakes, famines, and social ease. But, he that endureth to the end shall be saved. So, the emphasis of this prophetic verse is, that men ought always to be watchful, sober, and patiently enduring in the fiery trials of life.

The implication of the text is, that life is a struggle. What mature mind will say otherwise? When we think soberly and steadily upon life; when we review our own brief hard years; we must submit to the stern fact that we have survived out of struggle. Some days have been bright and cheery, while others have been heavy and sad. You know there have been times when some folks despaired of having real friends. Out of my study window now is a pathetic scene. There is passing the funeral car, carrying the dead body of a poor widow. Where will the undertaker bury her? In a pauper's grave. Her friends endured not until the end. Such scenes cause our gladness to cloy and darken the joy of living. Yet, we are not to forget.

"It is not just as you take it,
This wonderful life of ours;
Life's field will yield as you make it
A harvest of thorns or flowers."

The writer is a Christian optimist. But, his optimism is not so easygoing as to overlook the fact of sin. Yes, he means just that, SIN. As one looks into the faces of men on the busy city streets, or in the more wholesome country highways, he reads the bitter yielding to temptation. He that breathes the name of the victorious Christ, is surrounded by little imps and demons that would trap him into ruin. How nearly immersed at times, are we, into this cold, blighting world spirit! How it breaks into the most sacred precincts of life! For, in these days, even our Sunday life is in danger of losing its old-fashioned wholesomeness. Something is robbing us of our reverence for God's sanctuary. It is well for us to remember that the fear and worship of Jehovah is the beginning of wise living. Let us return to a more thoughtful worship and a more careful praying of "Hallowed be thy name." But of course, we are not meaning something that is put on one day and off on another. We are referring to that that moves and flows in the blood and becomes the atmosphere of the week.

And then, we are beset roundabout with the by-products of a lusting world: sickness, cares, and affliction. Everywhere there are folks carrying tremedous loads of sorrow, that will never be lifted from their hearts until and unless they "have fallen asleep in Jesus." It is not easy to plod on in life with a load that can not be lifted or a wound that does not heal. The gladest and freest know how true this is, and so, we move on in the way of the Nazerene. Have we sinned? Then we are never out of the cricle of his sympathy and love. It is great cheer to know that his mercy is infinite in its tenderness.

"I know not where his islands
lift their fronded palms in air;
I only know I cannot drift beyond his love and care."

And this is what our text says. Do you have the words? We are to live the enduring life that we might be saved. Now, it is an inspiring thing to see a saint passively holding out; but a much finer thing to see one actively enduring. And this is the larger meaning. The Dayton flood was a ruinous, destructive outburst of nature. But the Miami Conservancy would use these waters as the source of life and power; the same waters. And so, refuge in Christ not only saves from ruin when the floods of trial are on; but teaches us how to go on, sensible of the stormy, tempestuous way, yet unswerved and unchecked. When we are able to trail the Man of sorrows in a world of tears; when we are able to say, "This one thing I do", then we have come into the active grace of endurance. And endurance to the end is required. It is just as tho we are steering the ship of life into port; and the Captain of faith above, and the men of activity below, all must stay at their posts until the ship be safely anchored.

And then we shall be saved. St. Luke has it, "In your patience ye shall win your lives." That is, even now, we may come into possession of our lives. Did you ever see anyone who was making a day-by-day success in faith, courage, endurance, and all that makes for Christian culture and character? He had come into possession of a saved life; a redeemed personality. He was having an experience in self-surrender which says, "It is not I that live, but Christ that liveth in me."

The experiences of life are so varying, that we dare not look to the end of the road, but take one day at a time. This is what Geo. Klingle says in "The Journey of Life:"

"God broke our years to hours and days, that
Hour by hour, and day by day,
Just going on a little way,
We might be able all along to keep quite strong.
Should all the weight of life be laid across our shoulders, and
The future rife with woe and struggle meet us
Face to face at just one place,
We could not go; our feet would stop, and so
God lays a little on us every day,
And never, I believe, on all the way
Will burdens bear so deep, or pathways lie so steep,
But we can go, if by God's power
We only bear the burden of the hour."

BIBLE THOUGHTS

LET THIS MIND BE IN YOU, which was in Christ Jesus. Let nothing be done through strife or vainglory; but in lowliness of mind let each esteem other better than themselves.—Philippians 2:5, 3.

FOR GOD SO LOVED THE WORLD that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life.—John 3:16.

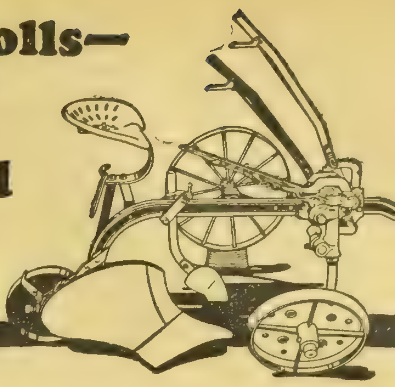
BLESS THE LORD, O my soul, and forget not all his benefits; who forgiveth all thine iniquities; who healeth all thy diseases; who redeemeth they life from destruction. —Psalm 103:2-4.

PEACE I LEAVE WITH YOU, my peace I give unto you: not as the world giveth, give I unto you. Let not your heart be troubled, neither let it be afraid.—John 14:27.

TAKE NO THOUGHT saying, What shall we eat? or, What shall we drink? or, Wherewithal shall we be clothed? But seek ye first the kingdom of God and his righteousness: and all these things shall be added unto you.—Matthew 6:31,33.

LET THIS MIND BE IN YOU, which was also in Christ Jesus. Let nothing be done through strife or vainglory; but in lowliness of mind let each esteem other better than themselves.—Philippians 2:5, 3.

**Landside Rolls—
Plow Stays
Down—
Makes Good
Seed Beds**



Hard work of plowing is eliminated for you as well as the horses, and you get a better seed bed when you use the light-running, all-wheel-carried, simple

JOHN DEERE
SYRACUSE NO. 210
SULKY PLOW

The rolling landside makes the No. 210 practically frictionless. All of the weight is rolled on oiled bearings. No dragging friction on furrow wall or furrow bottom.

The No. 210 can be used with slat or solid moldboards, chilled or steel. This provision for the interchange of equipment makes this plow adaptable for work in any kind of soil.

Bottom runs true and level all the time even when turning square corners. The front furrow wheel casters on the turn and guides the plow perfectly. Lever lock holds plow in line on the straight-away. Just before reaching the end of the field the lever latch is released. This allows the bottom to swivel freely on the turn. As the plow again settles to work in the straight furrow the latch seeks its proper position and locks. Driver's hands are free to manage team except when releasing latch.

Frameless construction—simple and strong. Two-axle support for front furrow wheel prevents binding or cramping

Don't fail to see this plow the next time you are in town. Write today for FREE BOOKLET on the No. 210. Address John Deere, Moline, Ill., and ask for Booklet EN- 43

"The Farm Paper of Service"

MICHIGAN'S "BLUE SKY" LAW

WE wonder how much THE BUSINESS FARMER readers know about Michigan's "blue sky" law, and especially if you appreciate what a really good law it is. We are all more or less interested in "blue sky" laws, and if you want to find out, provided you do not already know, something about the blue sky law in this state, we invite your attention to the article appearing elsewhere in this issue by Mr. Stanley M. Powell, Lansing correspondent of THE BUSINESS FARMER. At our request Mr. Powell made a study of this law for the purpose of finding out whether or not it is working satisfactorily.

Mr. Powell, as a part of his study, interviewed Mr. Duff, chairman of the Michigan Securities Commission, and this interview, which is most enlightening constitutes the major part of Mr. Powell's article.

In this interview Mr. Duff made the statement that "We believe our Michigan "blue sky" law is the best piece of legislation of its kind in the United States, but what we must do now is to educate the people up to the law." In other words, it doesn't make much difference how good a law you may have, if the people still insist on taking a chance on get-rich-quick schemes, they will put themselves out of range of protection by any law.

Michigan has a good "blue sky" law, a law that will furnish its citizens adequate protection, provided they will use a reasonable amount of caution, and stay within the bounds of protection furnished by the law.

The conclusion to be gained from Mr. Powell's article is that the Michigan "blue sky" law is working as well as could be reasonably expected. No one claims it to be perfect, but improvements are being made all of the time. It must be remembered that in perfecting such a law, you are dealing with an extremely clever bunch of people, and if there is a loophole anywhere, they will find it. The important thing, as we view it, is not how good the law is, but rather for the people of the state to help make it effective to the maximum degree possible.

HOW DO YOU FEEL ABOUT IT?

"I WOULD not trade my farm, in spite of all the agricultural depression, which you may hear about, and which I know about, for any business represented in this room today." This statement was made recently by James R. Howard, first president of the American Farm Bureau Federation, in an address before a group of business men, in which he gave his reason for believing that farming is the surest business in the United States today. In his opinion the present agricultural depression is an invitation to far-sighted men to get into farming, or to invest in agriculture.

Moreover, Mr. Howard went on to say "If any of you are qualified financially and physically and mentally, to run a farm, I unhesitatingly recommend that you go back to the soil." His reasons for such a recommendation are briefly stated as follows: "Whenever any commodity is below the cost of production, buy; it will surely go higher. Whenever any commodity is above the cost of production, sell; it will inevitably go lower. The products of the farm are, and have been, for four years below production cost. They must inevitably, sooner or later go higher, else all history in economics belie themselves."

He went on further to say that "Whenever men and capital are rushing in large numbers and volumes, toward an essential or non-essential industry, beware—stay out; the industry will soon be overdone. Whenever men and capital are being subtracted from an industry, particularly an essential industry, get into it. Your efforts and capital will not only be needed, but rewarded. The man who can stay or can go to the farm is bound, sooner or later, to strike pay dirt.

"During the past few years Michigan has gotten a reputation, whether justified or not, of having a large number of idle or abandoned farms. As a matter of fact, people have been leaving the farms by the thousands all over the country since the agricultural depression got in. It is no doubt true that there are too many people on the farms of America as it is; what our agriculture needs is not more farmers, but fewer and better farmers.

Mr. Howard's analysis challenges our attention and our serious consideration. Are we, who have a tendency to become bears, as they say on the stock exchange, on farming, really as far-sighted as we ought to be? We believe not.

Every farmer ought to get away from his farm occasionally, and get a better prospective on his business. Mr. Howard has done this, and that is perhaps one reason why he takes a different view of things than most of us who stick too closely to the farm. Further remarks that he has made are of interest:

"It is a good thing for every farmer occasionally to come to the city. It would be as much worth while if every one of you would get out on a farm for a couple of weeks every summer, and on the plow or in the harvest field, get some first-hand and worth while information regarding American agriculture.

"I have always noticed that when I come from the farm to the city, you men anxiously inquire how things are back home. I am glad to tell you that the soil has worked splendidly this spring, because of a good seedbed and good seed, the new corn is coming through the ground in spite of the cold and dry weather. The pig crop is above the average.

"All these products from all the farms of America will move toward the city within a year. The corn field cannot, because of slack markets or labor difficulties, be shut down for a week without serious loss, or for a month without total loss. Shutdowns for repairs or supplies or any other cause, extending beyond a half day, cannot be tolerated around the pig pen. The farmer's production is a 365-day-a-year proposition.

"There has been four things most largely responsible for the farmers increased efficiency. One is improved farm machinery, including the automobile. Another reason is the improvements of livestock, and varieties of grains and grasses. The third is a broadening intelligence of the farmer along lines of general education. Fourth is the pride of a man on the farm and his job at hand, and his determination to win regardless of obstacles."

There may be times when you feel like throwing up the farming job, and going to town where you can perhaps earn more money, but will you be better off in the long run? This is of course for you to decide, but if you feel that you are fitted for farming and that it is your work, think a long time before you give it up. Farming, one of these days is coming into its own, and the farmer is going to be on top of the heap.

MUSKEGON'S CITY MARKETS

AT Muskegon is being demonstrated the possibilities of a municipal market where the farmer-producer and the city consumer can deal direct. On another page of this issue, Mr. Carl M. Knopf describes in a very interesting article the city markets that have been established in Muskegon, some of the problems that have confronted the supporters of the market system, and how the plan is working out.

It is of particular interest to farmers, that it was not until the county farm bureau organization had taken hold of the market system that it proved a success. During the first season the market was operated under the direction of the city. It is needless to say that the farmers have a more vital interest in the success of a market system, and it is logical that the organization and direction of such a plan should be controlled by them.

There are many problems that naturally arise in conducting a successful market, and it stands to reason that it cannot be made a success unless the farmers work together in harmony, and with a firm determination to make the project successful. Mr. Knopf in his article states that the ideals for Muskegon markets are a long way from fulfillment, but still they are rendering an increasingly valuable service to both city consumers and farmer producers, the plan is making a reasonably good progress, and indications are that it will continue to do so.

His article is the first-hand study of what the farmers in the country surrounding Muskegon have done, and it should be especially valuable to other communities planning a similar project.

THE BOY AND THE ENGINE

DO you remember way back when the steam threshing rig passed the home farm, or came to do your dad's threshing—way back before the days of the automobile, tractor, motor truck, and stationary gas engine? As a boy—we are speaking to the men now—was there anything that ever gave you more of a real thrill than that old steam engine? Didn't you hang around it, and in your boyish mind picture what a wonderful thing it would be to run one of the things?

In fact, wasn't it the height of your ambition to some day be able to follow one of them around the country?

We are just indulging in a little personal retrospection now, but we believe it is typical of at least ninety per cent of the farm boys of the pre-gas-engine age. Frankly, we still get a thrill when we see a steaming threshing rig pass by, and we indulge ourselves in watching it out of sight and experiencing again the same boyish reaction we had back in the early nineties.

The steam engine is a back number to most of the farm boys of today; they get their real thrill from the internal-combustion engine in its various applications, but perhaps more from the farm tractor and the stationary engine, than from the automobile, if our own experience is any criterion.

The love of mechanics is inborn in most boys. If it were not true the use of mechanical power and labor-saving machinery would probably not be nearly so extensive as it is today. It is a good thing to encourage the farm boy's liking for engines and machines, and more than that, to satisfy that liking.

There is no doubt at all, but there are hundreds of boys who have left the farms, who unquestionably would have preferred to stay on the farm, if it had been possible for them to do the heavy drudgery of farm work with mechanical power and machinery.

Not that these boys are afraid of hard work, but they prefer to direct the forces of nature in doing their work, rather than by preforming it by brute strength. This is a mechanical age, and, it is only natural for us to want to do as much of the physical labor as possible with mechanical rather than muscle energy.

We would not encourage the purchase of more mechanical power equipment for the purpose of keeping more boys on the farm. Every boy is tempermentally fitted for a certain type of work, and not every boy that is raised on the farm should stay on the farm. If he is naturally fitted for farming, he should stay on the farm, but if he inclines naturally toward some other line of activity it is a serious mistake to try to get him to remain on the farm. However, there are unquestionably many boys who have left the farm, who really should have stayed on it, and who would perhaps be there today, if their fathers could have forseen the rapid transition from muscle power to mechanical power that is taking place in farming, and could have encouraged them to stay on the farm through the purchase of a stationary engine or a tractor, or both.

It is the forgone conclusion that mechanical power will some day replace most of the muscle power of the farm. There is no reason why this transition should not take place in farming as it has in manufacturing and transportation. What is more, you show us a farm boy today who says he prefers to farm with horses, and we will show you twenty farm boys who say they will not farm unless they can farm with mechanical power. Are we not right? Ask your own boy and find out.

CALVIN COOLIDGE, JR.

THE heart of all America, irrespective of political creeds, goes out in profound sympathy to President and Mrs. Coolidge in the loss of their youngest son, Calvin Jr. Indirectly a product of the soil, Calvin Jr. was not essentially different from any ordinary farm boy. He did not "pretend" because he was the president's son. He did not throw up his job on the farm when his father came into his high office. He was independent and wanted to earn his own spending money. It is said that the farmers for whom he worked remarked, at the time Mr. Coolidge took the oath of office as President: "So your father is President of the United States," and that Calvin replied with old-fashioned courtesy, "Yes sir; I suppose he is. What did you want me to tackle today?" His passing is untimely and regrettable to say the least; we can never have too many boys of the type of Calvin Coolidge, Jr.

PUBLISHER'S DESK

ANOTHER "BLOW OUT"

"Last December I received a printed circular from the Lakeside Tire & Rubber Co. from Chicago asking me to take up the agency for tires. I sent them on January 12th a P. O. order for $8.90 for a 30x3½ cord tire guaranteed for 12,000 miles. They were supposed to pay the postage according to circular but they sent a tire by express with 56c charges on it. We paid the charges but the tire did not weigh more than a pound and was full of holes so we sent it right back. They told the express people at first we had returned an old tire but as they, the express people, had examined the whole transaction they knew better and finally Lakeside Tire and Rubber Co. accepted the tire. I wrote them asking for the money but as yet have heard nothing."

WE received the above letter from one of our subscribers several weeks ago and we immediately wrote the Lakeside Tire and Rubber Company. We received no acknowledgement of any kind from them and after a few days we sent them another letter. And we got the same results—none. We came back with another letter. No answer. Letter number four was sent by registered mail and now comes back marked "Moved, left no address. Thus reads the story of another "fly-by-night" cheap tire company and a victim.

AN OLD FRAUD AGAIN

AGAIN the resurrection plant bobs up again under various attractive names in tempting advertisements—beware, cautions the United States Department of Agriculture.

In past years various concerns have advertised this plant for sale under different names, and usually at prices far in excess of its market value. It is often sold by these concerns under the name "rose of Jericho" or "rose of Sharon" and said to be obtained from the Holy Land and to have been mentioned by "Solomon, Isaiah, and other prophets." The circular of one dealer which calls it "Semper Viva or Rose of Jericho" and offers it for the modest price of twenty-five cents, describes it as "a deodorizer" and "a preventative of disease." Claims are also made that it is "a preventative of moths and that if a few are scattered about the house they will keep out mosquitoes."

Another concern calls it the "Persian Plant" or "Cinnamon Rose", mentioned by Isaiah in the Bible, and attempts to illustrate its appearance by giving a very poor figure of some cultivated primrose. The plant is said to bloom every thirty days, bearing "the most fragrant flowers in existance." Resurrection plant is, of course, not a seed plant, bears no flowers and is odorless, although the specimens sold by such concerns are often artificially scented.

A correspondent in North Carolina has recently sent the Department of Agriculture a specimen of this plant put up by an alleged "importing" company of New York, Jerusalem, and Montreal, and sold as "Genuine Rose of Sharon." After giving directions for growing the plant, the circular states: "Do not cut slips from these plants, as they propagate from seed. The roses go to seed only in Palestine." The regular price of this company is for plants 'potted, in blossom, 25 to 28 inches growth, red, white, or pink, $12; the bulb, dormant, red, white or pink, $2.75." As a special advertising offer, a set of three colors is sold for $2.75, or one "bulb" for 95c.

The true "Rose of Jericho" is a small white-flowered annual of the mustard family. It is a native of desert regions from Arabia and Syria to Algeria, and is supposed to be the "rolling thing before the whirlwind" mentioned in Isaiah. After flowering the eaves fall off, and the branches become hard and woody and roll up into a ball, bearing the seed pods inside. In this state the plants, uprooted by the wind, are blown about the desert. When the winter rains fall the branches spread back, the pods open, and the seeds quickly germinate. Dried plants retain for years the property of opening when moistened, although they do not "come to life" in the proper sense of the words. The plan was brought back to Europe by the Crusaders, and is the subject of many legends and much folklore.

Resurrection plant bears no flowers, has no fragrance or insecticidal value, and is in no way connected with the Crusaders or the Holy Land. Its sold under the name of "Rose of Jericho" or "Rose of Sharon" at exhorbitant prices constitutes an evident fraud. Its proper market value is about 25c, and it is well worth growing as a botanical curiosity.

Resurrection plant, a relative of the groundcedar and groundpine used in making Christmas wreaths, is a native of the deserts from Texas southward into Mexico. In the dry state the branches, which are thickly covered with scale-like leaves, roll up into a brown ball, but when placed in water they expand forming a green leafy rosette. The plant is offered for sale in curio shape, particularly in the southwestern states.

BEWARE OF CIVIL SERVICE "SCHOOLS"

THE United States Civil Service Commission and the National Vigilance Committee of the Associated Advertising Clubs of the World today issued a joint warning against misleading advertising of many so-called civil-service coaching schools. The following points are emphasized:

(1) No "school" of this kind has any connection whatever with the Civil Service Commission or with any branch of the Government.

(2) No school can give advance information regarding examination questions.

(3) No school can furnish civil-service information of value which can not be obtained without cost from the Civil Service Commission at Washington or its representative at the post office or customhouse in any of approximately 3,500 cities.

(4) No school can "guarantee" appointment in the classified civil service. Appointment can be secured only through open competitive examination under the civil-service rules. No school can cause a competitor to be certified for appointment out of the regular order, as determined by his examination rating.

The Civil Service Commission states that large numbers of applications for examination received at its office indicate that many civil-service schools accept as clients and take money from practically illiterate persons who could not possibly pass any kind of examination.

E. I. McKinley, deputy labor commissioner of Arkansas, it is said in the joint warning, recently has investigated correspondence schools of this class and authorizes the statement that he has concluded that the majority of them come as near being "fakes" as the postal laws permit. The "schools" that Mr. McKinley condemns are the ones that offer to qualify persons for civil-service positions or make a professional man of a laborer in a few weeks. Mr. McKinley says that schools which prepare for civil-service examinations rank second to "detective schools" in number.

Any good school, no matter what they are teaching, should be pleased to give many references as to courses and reliability, and if you are considering studying with some school we urge you to investigate before you invest. It is better to lock the barndoor before the horse is stolen than after. We are always ready to help our paid-up subscribers in this matter.

I wan to thank you people for helping me to get my money on claim No. 1491. I had been so long trying to get it myself and it was only a few days after I wrote you people that I had the money. C. A. W., Davison, Michigan.

Dear Editor:—I have received check from ——— for what I have had you put in claim for. I thank you ever sc much for your help and will be willing to pay you whatever you wish. Your friend,—M. S. B., Wheeler, Mich.

First Mortgage Real Estate Gold Bonds

The high standing of this house among farmers is the direct result of the pronounced quality of the 7% first mortgage bonds we offer for their investment.

Your Protective Service Sign Is Here!

After considerable delay we are glad to announce that the new Protective Service Signs have arrived and we are filling the advance orders as rapidly as possible.

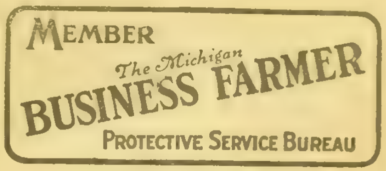
If you have not yet ordered your sign, do so at once, as the supply is limited.

This is a high class sign in every respect, made up in two colors, red and black on a white background, weatherproof, 5 x 11¾ inches in size, suitable for hanging on your fence, mail post, or other prominent place.

Remember this sign will serve as a warning to crooks, fakirs, quacks, and grafters, to keep away from a farm which is affiliated with The Business Farmer Protective Service Bureau.

Only a few thousand of these signs have been ordered and we are going to mail them to our friends—first come—first served—at actual cost, only 25 cents. We already have had advance requests for hundreds of these signs—They are going like hot cakes.—Fill in the coupon below, so as to be sure you get your sign before they are all gone.

THE BUSINESS FARMER,
Protective Service Bureau,
Mt. Clemens, Mich.,



5x11¾ inches Red and Black on White Background

( ) **I enclose a dollar for a two year renewal and 25c for a Metal Sign and certificate.**

( ) **My subscription is paid to 1925, so I enclose 25c for a Metal Sign and certificate.**

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

DEAR FOLKS:—I work so hard some days and get so tired that sometimes I think "Oh, if I only had enough money so that I would not have to work, how happy I would be." All of you have felt the same way. But would you or I be happy if we had nothing to do? Could we sit idle all day and enjoy ourselves? Have you ever thought how it would seem to have no duties to perform, just sit around? A well known Canadian physician declares that idleness, more often than work, leads to old age and death, and I believe him. In India and China, the lifetime of the slowgoing, peaceful native averages from 19 to 25 years while here in America the average length of life in our industrial centers is from 35 to 60 years. As long as we have our work to do and we do it with our heart into it we will not have time to grow old. When I stop to think of these things I realize how lucky I am that I have my work and how happy I should be. And I am happy and thankful for my many blessings.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

SLIDIN' DOWN A STRAW STACK

By Anne Campbell

[illegible]in' down a straw stack,
Me an' Harve an' Liz;
Slidin' down a straw stack,
Greatest fun there is!
Far as eye can see 'em,
Meadows stretchin' green;
There's a crick a-windin'
Lazy-like between!

Slidin' down a straw stack!
Hear the cawin' crows?
Slidin' down a straw stack!
Feel the breeze that blows?
There's the cows a grazin'—
Sheep a-browsin,' too.
I kin see the barn now,
Painted red and new!

Slidin' down a straw stack!
Gee, it's heaps o' fun,
Slidin' down a straw stack
In the mornin' sun.
See the house a-waitin'?
There's the pump an' well.
Soon we'll hear it ringin'—
Good ol' dinner bell!

Slidin' down a straw stack
When the sun is low;
Slidin' down a straw stack!
Soon to bed we'll go.
We won't mind the pickers
Stickin' all around.
They won't bother much, 'cause
Gee, we'll sleep too sound!

(Copyright, 1924.)

SMALL HOPE FOR THE FRECKLED

FOR those frenzied maidens who seek freedom from freckles, the world must ever remain sad. For the plain truth is that, once freckles have blossomed into the rich brown of their maturity, there is no way of getting rid of them, says Hygeia.

Nor for those individuals who, in the summer sun, tend to freckle instead of tan is there any sure way of prevention. Unless, of course, with Victorian admiration of pallor, the young lady shuns the sun's determined gaze.

Ordinary freckles that come on or become exaggerated after exposure to sunlight are a deposit of normal pigment in the skin. This sort of freckle corresponds to tanning. In the person that tans evenly, this increased deposit of pigment in the skin is evenly diffused; in the person that freckles, the pigment occurs irregularly, usually in spots.

The difference represents a congenital difference in the structure of the skin. For some reason or other, which we do not know, in the individual that freckles the pigment-forming cells are irregularly distributed and under the stimulus of sunlight produce irregular pigmentation.

Most of the pigment in these conditions is in the outer layer of the skin, but some of it is down in the deeper part, what would be called in the vernacular, the "fleshy" part. Only by destroying the skin down to a point where it is sensitive and where distinct wounds would be produced could this coloring be removed. Even in the superficial part of the skin the pigment is seated relatively deep, and there is no way of getting rid of it without causing an extreme peeling off of the superficial layers. No practical way in which this can be done successfully exists.

Effective methods of removing the pigment involve the use of strong irritants like solutions of corrosive sublimate. These are put on until they produce considerable irritation and, in the peeling that follows, a good deal of the pigment is removed. This is not a safe procedure for the patient to use himself, and is not a satisfactory procedure in anybody's hands.

In many of the freckle creams and ointments on the market, ammoniated chloride of mercury is used. This is a dangerous preparation if used to excess, and it is of no more service in such strength as any one would dare to employ it in removing freckles than so much flour.

In short, there is no way of getting rid of freckles. The only way to prevent them in a person who tends to freckle is stay out of the sun. Or wear a sunbonnet!

WHEN SUNDAY COMPANY COMES

THE folks who "drive out" to see us on Sunday afternoon usually have a big dinner at home, and, unless they have been specially invited, it is not necessary to provide a regular meal. Fresh eggs will solve the problem with little work and few dishes to wash. In the morning boil ½ dozen for half an hour, slowly, so they will not be tough; take off the shells and put in a cool place. Make a boiled salad dressing on Saturday and when the Sunday company comes try serving this sort of a supper: Egg sandwiches—jam—cake—lemonade or tea.

For the sandwiches—cut the boiled eggs in small pieces, mix with a liberal amount of salad dressing, put between slices of either white or brown bread, quite a quantity of brown bread, garnish with watercress, parsley or small lettuce leaves and you have a delicious, sustantial sandwich. Make plenty, for they will "go like hot cakes."

Here is a recipe for an unusually good cake, one that will keep moist for several days—especially if an apple is kept in the cake box. Bake the cake in two layers. Cream 2 tablespoonsfuls butter with cup of white sugar (or, better, 1⅓ cups of brown sugar); beat in one egg, add ½ teaspoon of cinnamon and ¼ teaspoon of nutmeg. Dissolve ¾ teaspoon of soda in ¾ cup of sour milk, then sift in gradually 1⅔ cups of flour, 2 teaspoonfuls of baking powder—and, last of all, 1 cup of cut and seeded raisins. Make an icing of white of egg with an equal amount of milk, and stir in enough confectionary sugar to spread easily; flavor with vanilla. This icing is delicious and easier to make than boiled frosting. Did you know that an apple cut in half and placed in the cake box will often soften dried-out cake or cookies?

CARE OF KITCHEN STOVE

NICKEL-TRIMMED stoves require daily care. It is not difficult to keep nickel clean if it is thoroughly wiped each morning. If grease and dust is allowed to accumulate, the nickel must be washed with hot, soapy water and polished with a soft, dry cloth. If stains remain, an application of nickel polish may be used. Stove polish may be used to blacken the top of the stove. However, this is not necessary provided the stove is washed each morning with a damp cloth and rubbed dry with crumpled newspaper. Paraffin oil may be used rather than blacking. Apply it with soft cloth when the stove is cold. Overheating the stove is responsible for the white appearance of the lids.

BABY'S SUMMER CLOTHING

DURING the summer dress baby lightly and loosely. A loose, cotton, thin shirt, without sleeves, is enough in hot weather. Strip him on hot days and let him lie around naked for a few hours indoors.

Baby's underwear, at other seasons should be cotton and wool mixed.

Baby's feet must be kept dry.

Baby's socks should be knitted of soft woolen or cotton and wool yarn.

Baby's throat must not be tied up except in severe weather. Throat protectors make weak throats.

Babies should have broad, soft, and loose shoes.

Babies should never have their faces protected with veils except in severe weather. They need the air which veils keep away.

In putting on baby clothes, put them on over the feet. This avoids any possible disturbance to the head. Shoulder buttoning is a convenience.

HANDY TO KNOW

WHEN an individual feels heavy and depressed, and there is a sense of sleepiness and little twingy pains in the joints, warning signals are being given that the system is clogged and the liver torpid. If the signals are not heeded, tonsilitis, colds, bilious attack, or rheumatic trouble may soon manifest itself.

It is wise to take prompt measures for relief. The patient should be put on a very light diet, given a thorough cathartic, a good hot bath, and an opportunity for a long and restful sleep in a well ventilated room. This is usually sufficient. If a sore throat persists, gargle with a solution made of one-third listerine, one-third peroxide, and one-third water. If relief is not gained after a short time, call the doctor.

* * *

Hiccoughs are a distressing malady, and sometimes continue until they are serious. The usual home remedy is to take a drink of cool water, sipping it slowly; or to take a spoonful of dry sugar, dissolving it in the mouth. For an older child or grown-up a simple remedy which usually proves effective is to moisten a lump of sugar with vinegar, holding it in the mouth until it melts.

* * *

In case of a wasp or bee sting, relief may be gained by touching the inflamed portion with amonia of household strength. However, if one is away from the base of supplies, a poultice made of wet clay or clean mud will often give great relief.

Personal Column

Bothered With Ants.—Seeing that you help so many concerning different things, I thought I would write and see if you could help me in regard to getting rid of ants. They are the big black kind and only get into sugar and sweet things. There seems to be millions of them! Have looked every where for nest but so far have been unable to find it. They nearly drive me crazy getting into things. If you can help me out will be very thankful. I can use poisons of any kind as there are no small children. Thanking you for past favor,—Mrs. L. L. F., Millington, Michigan.

—In order to permanently rid a dwelling of these nuisances it is necessary that their nests be destroyed, and the easiest way to destroy these nests is to induce the ants themselves to do the work for you. A mixture of tarter emetic and extracted honey at the rate of one part of the poison to twenty of the honey seems about the right combination for the sweet loving ants, it kills the ants eventually but not quickly enough to hinder their getting back home and destroying their nests. We find that very thick honey is best. We even like to thicken it with powdered sugar and all mixing should be done without heat so as to keep the honey thick. The reason is that if the honey is thin the poison will settle out and the ants will not get it.

Get your druggist to mix up an ounce or so of this material and place it where nothing but the ants can get to it. I would invert an empty wooden box over the dish containing the poison or label it and put it away in some such manner that neither children nor any other creatures can get to it or mistake it for food. If it is impossible to take such precautions then it is better not to attempt to get rid of the ants in this manner. The ants will come to the poisoned honey and usually all that is necessary is to leave the poison-bait exposed for a few days or weeks until the ants have all had an opportunity to partake. Large ant-nests in the lawn may be treated in a similar manner. Place the poison-bait in a piece of tin or in a shallow dish on the nest and invert an empty wooden box over the dish and anthill, to prevent other than ants from getting at the poison.

Remember, that tartar emetic is a violent poison and extremely dangerous and just as effective against humans and pets as against insects. Take every precaution possible in its use and as soon as it has accomplished its purpose bury the remainder or take precautions which will prevent its being the cause of an accident later on.—R. H. Pettit, Prof. of Entomology, M. A. C.

Reproducer for Edison Phonograph.—If any reader has a model C reproducer with needle for an old style Edison phonograph playing two minute cylinder records that they wish to dispose of will they kindly write, naming price wanted for same?—Mrs. Floyd Archambault, Elwell, Michigan.

Another Wants Reproducer.—We have an Angelophone phonograph and the tone arm got broke and I thought if I wrote to your page, that some of the readers might have one like it that they would sell. If some one has one with the reproducer on it and the fastening I think we could use it. Please write first. Thanking you in advance, I am—Mrs. Harold Sprague, Harrison, Mich.

Please Help.—Can any one tell me how to do up pickles in a pork barrel so they will keep like salted pickles? I want them put right in the vinegar with spices ready to eat from the barrel.—C. K.

Bed Bugs.—Three years ago, when I started to keep house, I had so many bed bugs that we couldn't sleep. I did as follows and have not had any more trouble: Take out your bed springs, dissolve 1 cup of lye in 2 quarts of boiling water and pour through all the cracks. That kills everything. Now take 1 cup of turpentine and 1 cup of wood alcohol and mix, put in an oil can (a sewing machine can I used), and pour in all cracks where they keep themselves and you will find after going over the second time that they are all gone. Hope you will have good luck with it as that is sure a troublesome job. I am—Mrs. H. W., Sebewaing, Michigan.

—if you are well bred!

Finger-Foods.—Nature's implements are used to eat: bread, crackers, rolls, cinnamon toast, sandwiches and cake, with the exception of iced cakes, strawberry shortcake, layer cakes, and other juicy cakes of the kind, where a fork is more comfortable and less messy. If you find it possible to use the fingers when eating a juicy peach or pear, a napoleon or a creampuff without dripping juice or smearing cream about, you are infiringing on no table law to do so; but if you cannot manage neatly, use a fork. French fried potatoes and Saratoga chips should not be eaten with the fingers: they form part of the meat course.

When they appear as table relishes, celery and radishes are finger foods, and this also applies to small cakes, olives, bonbons, nuts, raisins and raw fruits, like grapes, cherries and small plums.

Strawberries, when they are served in "exhibition size," unhulled, should be served in apple bowls or plates, with powdered sugar on the side. They are raised between thumb and forefinger of the right hand, rolled in the powdered sugar with which they are served and thus eaten.

Menu for July 19th

Iced Bouillon
Broiled Chicken
Mashed Potatoes New Peas
Tomato Mayonnaise
*Red Raspberry Shortcake, Hot Marshmallow Sauce
Coffee

***Red Raspberry Shortcake.**.—4 cups sifted flour, 3 tablespoons baking powder, 1 teaspoon salt, 2 tablespoons fat, milk, and 2 quarts red raspberries. Sift baking powder and salt with flour, rub in fat, then with fork stir in lightly and quickly sufficient milk to make soft dough —too soft to roll. Turn it into greased tin, and bake in hot oven 30 minutes. Unmold, and leaving it inverted, cut circle around top within 1 inch of edge; lift off circle of crust, and with fork pick out crumb from center, leaving about ¾ of an inch of biscuit around sides. Spread inside cake with butter, fill with crushed raspberries, which have been standing ½ hour or more mixed with enough sugar to sweeten them. Turn off juice from berries before filling cake. Replace the circle of crust, and serve with following sauce. ½ pound marshmallows, ½ cup confectioners' sugar, and ½ cup boiling water. Cut marshmallows in pieces and melt in double boiler. Dissolve sugar in boiling water, add to marshmallows, and stir until blended. Serve hot with shortcake.

RECIPES

Cucumber Pickles.—Select cucumbers of pickling size and place in 2 gallon jar with 1 cup salt sprinkled over same. Over this pour boiling water and let stand until morning. Then wash from this, throw water away and place cucumbers back in jar. Cover with vinegar and add ½ cup salt, ½ cup mustard and ½ cup sugar. Add ½ cup sugar each morning until 4 cups have been used.—Mrs. F. A.

Yellow Nut-Bread.—6 cups flour, 6 tablespoon baking-powder, 1½ tablespoons salt, 1 cup sugar, 1½ cups nuts, 4 egg yolks, 3 cups milk, ¼ cup melted butter.

Mix and sift the dry ingredients and add the nuts. Beat the egg yolks and add to the milk. Then combine the mixtures and beat in the melted butter. Last, pour into greased tins, let stand twenty minutes and bake forty-five minutes in a moderate oven (350 degrees Fahrenheit.)

Chicken a la King.—1 cup chicken fat, 1 cup butter, ½ cup corn starch, 1 quart chicken stock, 1 quart hot milk, ½ tablespoon salt, 1 pint cream, 2 quarts chicken, ½ pound fresh mushrooms, 1 pint pimento, 8 egg yolks.

Melt the chicken fat and butter, add corn starch, and when well mixed pour on the chicken stock. When beginning to boil, add the milk and cream. Stir constantly and carefully until thickened, then cook over water one-half hour, stirring occasionally. Add the chicken (cooked and cut in small pieces), the mushrooms (peeled and sliced) and the pimiento (cut in strips.) When thoroughly heated, add the beaten egg yolks and salt. Add more salt if desired.

The Runner's Bible

(Copyright by Houghton Mifflin Co.)

Ye shall know the truth and the truth shall make you free. John 8:23.

A realization of the Truth will banish every ill. It is the light which reduces darkness to nothingness. Apply the Truth to evil, and the evil disappears.

If you are not in conscious health clear away your mental darkness by the knowledge that you are not under any so-called law or penalty of the flesh. You are under the law of God which decrees health and happiness.

I am the Lord that healeth thee. Ex. 15:26.

AIDS TO GOOD DRESSING

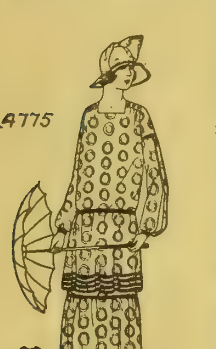
BE SURE AND SEND IN YOUR SIZE

4771. A Pleasing Apron Style.—Dotted percale is here illustrated. One could use cambric, drill, gingham or percale for this design. It is a very comfortable model unencumbered by sleeves and yet affording ample protection to the dress worn beneath it. This model could do service as a sleeveless over dress, if the back edges of the skirt are closed in a seam. Sash ends would form a smart finish. Pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 3¼ yards 36 inches wide.

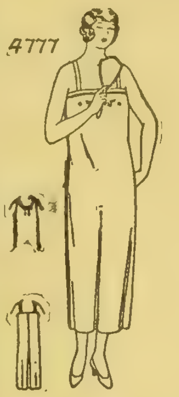
4775. A Pretty Summer Frock.—Crepe de chine with bands of ribbon would be a pretty development for this design. Figured voile, taffeta or dimity would also be pleasing. The sleeve may be finished with or without the peasant portion. This Pattern is cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 6⅜ yards of 32 inch material if made with long sleeves. With short sleeves as in the small view 4⅞ yards of 40 inch material is required.

4777. A Slip with New Lines.—This model is smooth fitting, with fullness at the centre back laid in a deep inverted plait. It may be finished with shaped shoulders or camisole top. The Pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 3⅜ yards of 36 inch material, if made with shaped shoulders. With camisole top ⅜ yard less is required. The width at the foot is 1⅞ yard.

4776. A Simple Apron Frock.—A good feature of this model is the side closing. It makes the apron more comfortable to adjust, and is attractive. This is a good style for cambric, percale and gingham. One could also use sateen or unbleached muslin. The Pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large 46-48 inches bust measure. A Medium size requires 4¼ yards of 36 inch material.



4775



4777

4763. A Popular Style.—A very fitting accompaniment to the new suits is here shown. One may wear a bodice skirt and jacket with a waist coat such as this. Brocaded silk, broadcloth, flannel, linen and ratine may be used for its development. The Pattern is cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 1¼ yard of 40 inch material. For collar and pocket facing of contrasting material ¼ yard is required.

4760. A New Skirt Style.—This model is excellent for stout figures. The panel may be of contrasting material or may be trimmed with braid. The Pattern is cut in 7 Sizes: 25, 27, 29, 31, 33, 35 and 37 inches waist measure with accompanying hip measure 35, 37, 39, 41, 43, 45 and 47 inches. The width at the foot with plaits extended is 1⅞ yard. To make the skirt for a 29 inch size will require 3⅝ yards of 32 inch material.

4785. A Comfortable Frock for "Mother's Girl."—This is an ideal style for the slender active girl. It will be very pleasing in the development indicated, as well as in other materials or combinations. Linen and gingham could be combined. Or, one could use voile or pongee, with pipings of a contrasting color, or of white. The Pattern is cut in 4 Sizes: 4, 6, 8 and 10 years. An 8 year size requires 2 yards of one material 36 inches wide. To make as illustrated will require ⅞ yard of plain material and 1⅜ of figured goods.

4781.—A Pretty Frock for the Growing Girl.—This is a good style for a combination of materials. It is also nice for organdy, batiste, pongee or printed fabrics. The Pattern is cut in 4 Sizes: 8, 10, 12 and 14 years. A 12 year size requires 3⅝ yards of 32 inch material of one kind. To make as illustrated will require 1⅜ yard of figured or striped material and 2¼ yards of plain material. Without the panels the dress will require 2⅜ yards of material.

No Odor—No Wicks *No Noise—No Smoke*

Gain new cooking ability with a smokeless, odorless Vapo Oil Range

Operates same as a gas stove because it burns gas

The Vapo is the highest grade oil range built and the most economical. Wickless, smokeless and odorless, it gives you more service per gallon of fuel, more service per square foot of space and more service per dollar than any other oil stove because of the remarkable, patented Vapo burner. Users everywhere are delighted. Thousands of dealers now sell this year-around oil range.

Cuts down work in the kitchen

No more long hours in the kitchen over a slow cooking stove. No more soot on cooking utensils. No more smarting eyes. No more trouble and annoyance with wicks and chimneys. You turn the Vapo flame up or down with a lever valve, same as a gas range. It has no wick. It has no wick substitute.

Cook a week on 7 qts. of fuel

That is what users say they are doing with the Vapo. A single burner operates 32-36 hours on a gallon of kerosene with flame turned high. At simmering heat it gives 50-60 hours service.

Vapo burner generates gas

It converts kerosene into hydro-carbon gas which burns with a hot, clean, blue flame which does not smell nor smoke nor smart the eyes. Flame can be turned from low to high and back again easily. This wonderful burner can't be clogged. Food or liquids can't boil over into burner and put out flame.

Bolo oven bakes and roasts same time

Movable Bolo plate makes oven big or little. Heat can be crowded into small space and intensified for quick baking and roasting. Makes two ovens in one. Slow and fast baking and roasting can be done at the same time. No other oil stove offers this advantage. Have your dealer show you this and other Vapo conveniences.

Write for folder describing the complete Vapo line. Sent free on request. Postal will bring it.

WE WILL PAY YOU ....For Your Spare Time

DO you have a little spare time each day that you would like to put to good use? We will pay you well for your spare time, and you can be out in the open air or stay in the house and do the work. You are not oblidged to devote and certain amount of time each day to the work, but can do it as you can or feel like doing. We all know how handy a little extra money comes in on the farm these days. If you are interested write:

CIRCULATION MANAGER
The Business Farmer,
Mt. Clemens, Mich.

The Children's Hour

DEAR girls and boys:—Have you ever played a game called "Japanese Tag"? I saw some girls and boys playing it the other day and they seemed to be having lots of fun and said they liked to play it better than just ordinary tag. I will explain how it is played.

The players are scattered within a limited playing area. This game is played like ordinary tag except that "it" must place one hand on the spot where he was tagged and hold it there while trying to tag another man. For example, if you were "it" and you tagged someone on the shoulder he would have to keep one hand on his shoulder where you touched him until he tagged another. While I was watching the children play the game the other day one of the boys tagged another on the ankle and maybe that boy did not have some time trying to tag someone else. Just try running while holding onto one ankle with your hand. This boy fell, head over heels, several times but did not hurt himself. Any person running outside the playing area automatically becomes "it".

Let me know if you like this game and perhaps I will tell you about some others.—UNCLE NED.

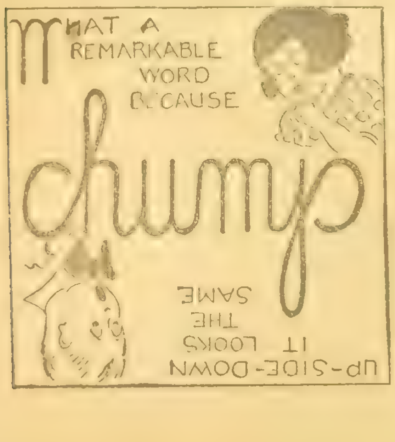
OUR BOYS AND GIRLS

Dear Uncle Ned:—It has been seven months since I wrote to you and since then I have been in Detroit, but I'm not going to tell any thing about it because it takes too much room. Well, I started to ride around in the country again. It seems good to be in the country. I was by some old friends yesterday and there is a river that runs right through their farm. My but it certainly is beautiful around there. The letter I wrote before didn't escape many children from around Bad Axe. I met quite a few people and they said, "Aren't you the girl that wrote to the Children's Hour?" I said, "Yes!" That girl that lived in Elton; I think her name is Hazel Baker, I'm not sure,—well she only lives about 10 miles from Bad Axe. I have never met her yet, but probably I'll meet her some day. She writes some nice letters, don't you think so? I'm corresponding with quite a number now. I described myself in the last letter so I'll not do it this time. Anybody over 15 years of age may write to me. I'll answer all letters. When school is out and I haven't anything to do, I'll write a story and send it to the children's page. I just love to read and write stories. Well as my letter is rather long I'll close hoping to hear from you soon, I mean the cousins. I sign myself Elizabeth Ebevle, 308 S. Silver St., Bad Axe, Michigan.

—Send along your story, Elizabeth.

Dear Uncle Ned:—May I please join your merry circle? This is the second time I have written but I am not going to quit writing till Mr. Waste Basket gets his fill. We have taken the M. B. F. for a long time and like it real well. I am a tomboy, as my mother calls me, but I don't care. I have bobbed hair, dark blue eyes, I am 5 feet 2 inches in height, weigh 110 pounds and am 16 years of age. Do you think I am very big, Uncle Ned? I can cook, bake bread, cakes and pies. I like to bake when I have good luck. How many of the cousins like to go horse-back riding? I do and think it loads of fun. The phonograph is going now, the record that is on is: "It ain't gonna rain no mo'," I like it. I do not paint or powder but I am going to wear knickers this summer when I help my brothers make hay. I wish some of the boys and girls would write. I hope my wish comes true. I will answer all letters. Your want-to-be niece,—Agnes Posey, R3, Box 94, Marine City, Mich.

Good Evening Uncle Ned:—What a lovely evening too. I have just passed the eighth grade examination and intend to go to high school this fall and think if boys and girls have the chance to go why not do so. Isn't that right, Uncle Ned? Florence Coleman is fourteen years of age. Now don't forget the letter if I am correct, Florence. My but don't we have cold weather? It seems as though its never going to be warm. Uncle Ned, do you like a Ford car? We have two of them. Oh say cousins, wouldn't it be nice of Uncle Ned if he would only print his picture in the M. B. F.? Come now Uncle Ned be a good boy for once. We will be real good if you do. I am some coaxer am I not? Ha! Ha! Well I guess its been a long time since I had my letter printed so will describe myself: I am five feet and three inches tall, weight one hundred and one pounds, have brown eyes and brown bobbed hair. Well as my letter is getting long will close hoping Mr. Waste Basket is asleep when it arrives. I will try to answer all letters received if the cousins will write to me. Your niece,—Helen M. Goodrow, Hale, Michigan.



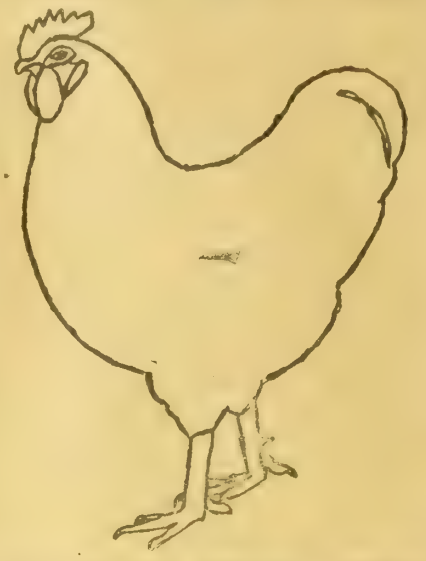
—By all means I think girls and boys should go to high school. As for my liking a Ford car, well I drive one myself. I have thought some of printing a picture of myself but there is one drawback—I cannot find a photographer who will take the chance of breaking his camera.

Dear Uncle Ned:—May I join your club? I noticed a few letters about having "correspondence scrambles". I would just enjoy having them. I am sending a story composed by myself. I hope you will accept it. Your friend,—Marie Arntz, Vickeryville, Michigan, Box 71.

The Crickets Party

Last night there was so many unusual noises in our neighborhood that I couldn't get to sleep. So I got up and dressed and went out to see what was going on. The sound seemed to be in the direction of the barn. On approaching the barn I saw great crowds of crickets, and grasshoppers, gathering around in different places, and many of them going through the barn door. And then I decided what was going on. Mr. and Mrs. Cricket were giving a barn dance in honor of the neighboring crickets and grasshoppers. They surely had a fine orchestra and I do not think I ever saw finer dancers than they were. They danced square dances and also many round dances. Then Mr. and Mrs. Cricket served ice cream, and many delicious cakes, out under the apple tree. Their tables and also the barn were nicely lit up by the lanterns of the little fireflies. They then bid Mr. and Mrs. Cricket good-night and returned to their many homes in the clover fields.

Hello Uncle Ned:—It sure is about time some one from Chassell is making a little noise. I have often looked for letters from here but never saw any in print, so I thought I'd be the first one to try my luck. Chassell, a little town, is situated on the very shore of a little bay called, "Portage" in the far northern point of the Keweenaw Peninsula. I live on an eighty acre farm two miles south west of Chassell. My father takes the M. B. F. and we all enjoy reading it very much There are seven of us children; two boys and five girls. My oldest brother, Jack, died a year ago and we all miss him very much. I am about 5 feet 2 inches tall and weigh about 100 pounds. I have dark red hair, that is not bobbed, and am fair but a few freckles on my nose. I am fourteen years of age and in the ninth grade at the Chassell high school. I am taking Latin I, English IX, Algebra and Bookkeeping. My birthday is July twenty-ninth. Have I a twin? If I have will you please write? As my letter is getting quite long and I can see Mr. Waste Basket running around the corner I will have to close. Will all the nieces and nephews write to me as I will answer all letters I receive. Your niece,—Ida Kaspala, Chassell, Michigan, R1, Box 75.



Drawn by Leona Green, R. 1, Prescott, Michigan.

Dear Uncle Ned:—Would you let two Marlette girls join your merry band? We live on farms and go to high school. We are sophomores and like school fine. We will send a big fat letter to the one that guesses our middle names. One, Zetta Hobson, starts with V and has six letters in it. The other, Merle Davies, starts with L and has five letters in it. We both live 2½ miles from town and walk to school almost every morning. Hoping to hear from some of the cousins. We remain,—Merle Davies, Zetta Hobson, Marlette, Michigan.

Dear Uncle Ned:—Here I am again after such a long time. It has been three years since I wrote to you, but during that time I have read with interest every issue of the M. B. F. My school was out in January. Immediately after my school closed I went to Danville, Kentucky, and stayed a few weeks with my sister. I received several letters from girls of different towns in Michigan, after my other letter was printed. Some of you perhaps will remember me. I will close with a few riddles. What is the difference between a sewing machine and a kiss? What is the difference between a hen on a fence and a penny? In marble walls as white as milk, lined with skin as soft as silk, within a fountain crystal clear, a golden apple doth appear. No doors are there to this stronghold, yet thieves break in and steal the gold. I would like to hear from some of the cousins. Your niece,—Hazel Lee Thompson, R4, Box 42, Waynesburg, Kentucky.

Dear Uncle Ned:—May I join your merry circle? I am a girl 11 years of age and have blue eyes, brown hair, and am 4 feet 9 inches in height. I am a brunette. I have two sisters and one brother. We live on an eighty-acre farm and have 160 acres beside. We have three goslings and 75 little chicks. We have an incubator and 380 eggs set. We have five turkey hens and one gobbler. I am in the sixth grade at school. We have a club in which we study current events, current school topics and debate. At school we play ball. We have 6 horses and twenty head of cattle. For pets we have a dog named Jiggs and two cats. I go one and one half miles to school. The name of our school is Maple Grove. Well I guess I will close and I wish some of the boys and girls would write to me. Your new niece—Freda Cameron, R3, Deckerville, Michigan.

Dear Uncle Ned:—For some time I have been a silent reader of the Children's page and have at last scraped up courage enough to write. I am a girl 5 feet 5 inches tall, weigh 124 lbs. I have light curly, bobbed hair and blue eyes. I wonder if I have a twin? I am 15 years old, my birthday was the 24th of May. I am in the 10th grade at school. We live on a thousand acre ranch; it is called the "Colby Ranch" and is 2½ miles from school. The subjects I take are Algebra, History, English and Economics. There are three lakes and part of another on this ranch, so my greatest delight is fishing and rowing. I have two sisters older than myself and three sisters and one brother younger. My two oldest sisters both graduated this spring, one from Country Normal and the other from high school. I would like to hear from some of the cousins and will answer all the letters I receive. Your niece and cousin, —Alice Dakin, Stanton, Michigan.

Dear Uncle Ned:—May I join your merry circle? I wrote once before but I guess the waste paper basket gobbled it up before it reached you. I will describe myself: I am 4 feet 10 inches tall, light brown hair and gray eyes. I am 11 years old. I have 2 brothers and 1 baby sister, a father and a mother and a dear grandma. I like to go to see my grandma very much. I belong to the M. E. church. There are 21 girls in my Sunday school class. I would like very much to hear from the other girls and boys of M. B. F. Your loving niece,—May Belle Hess, 1381 Ferry Ave., Pontiac, Mich.

Dear Uncle Ned:—May I join your merry circle? I will describe myself. I am ten years of age, four feet five inches tall, have bobbed hair and weigh sixty-nine and a half pounds. Next fall I will be in the sixth grade at school. My father takes the M. B. F. and likes it very much. For pets I have two grown kittens. I belong to a Sunday school class and also a society called "Golden Rule Juniors" and it meets just once a month at the church. We take our own dinner and have a little program afterwards. I enjoy it all very much. I guess this is enough for this time. From a want-to-be niece,—Ruby Boyenga, Fennville, Michigan, R1.

Fuzzy Owl Learns a Lesson

MAMMY Owl made a warm, cozy, comfy home in a big tree in the forest, for her four Small Owlies. She made it of large dry sticks and crooked twigs. Then she lined it with soft grasses and feathers. It was indeed a fine place for four Small Owlies to live.

Mammy Owl had a little talk with Small Owlies before they all, including Pappy Owl, moved into their new quarters.

"Now, Small Owlies, you are only tiny, baby birds, and you must not leave your home at any time. If you do harm will surely come to you."

But one day when the Small Owlies were lying all cuddled together in their warm, cozy, comfy home, in the big tree in the forest, one of the tiny Owls, Fuzzy, by name, peeped over the edge of his nest and saw a big, brown bag lying on the ground.

"Oh, oh, oh," cheeped Fuzzy, "what do you suppose is in that brown bag Pappy Owl brought home?"

Suddenly three other queer little heads with sharp black eyes showed over the edge of the big hole. The tree looked very, very old and forsaken and gave no signs of life within, except the eight big eyes peering curiously out of their warm, cozy, comfy home.

Now Baby Owls are the most curious of birds, and Fuzzy Owl was the most curious of the four Small Owlies.

"I must see what is in that big, brown bag Pappy Owl brought home," he chirped. "Oh, look, it must be something alive!"

No sooner had Fuzzy Owl said this than he jumped from his nest, lighting on the ground with a soft thud. The other Baby Owls squealed with fright, "Mammy Owl, Pappy Owl, come quick, come quick!"

Fuzzy Owl hobbled over to the brown bag and my, oh me, what did he do? but untie the string that was around the bag.

The Baby Owls in the tree squealed and yelled as loud as they could, "Mammy Owl, Pappy Owl, come quick! come quick!" No sooner had Fuzzy untied the big, brown bag than out jumped a big fat rooster.

The first thing the rooster did was to crow very, very loudly. The crowing frightened Baby Owlies so they trembled with fear and called more wildly than ever, "Mammy Owl, Pappy Owl, come quick! come quick!"

Fuzzy Owl was more frightened than ever. And even Mr. Rooster was frightened at so much noise.

He started to run around in a ring so that he might exercise his legs as he had been in the brown bag a long, long time.

Fuzzy Owl thought he was after him, and he yelled so loudly and wildly, "Mammy Owl, Pappy Owl, come quick! come quick!" that at last Mammy Owl and Pappy Owl, who had been out in quest of rats and mice for the Small Owlies, came flying home, flopping their wings and screaching.

Mammy Owl grabbed Fuzzy, who was, by this time, too frightened to stand on his little legs, and put him back in his warm, cozy, comfy home.

Then, did she scold poor frightened Fuzzy Owl for being so curious?

Indeed no! She felt that the loss of the good fat rooster which Pappy Owl had brought home to kill for the Baby Owlies, and the fright Fuzzy Owl had had would teach him to never, never be curious again. And, indeed it did!—Helen Gregg Green.

Print the name of an animal, beginning with "O", in the diagonal 1-4, and the name of an animal beginning with "M" in the diagonal 2-3, and have six words of six letters each as a result.

Answer to last puzzle: CARTHAGE (Cart hage), WEBB CITY (Webs ity), MOBERLY (Mo burr ly).

The Experience Pool

Bring your everyday problems in and get the experience of other farmers. Questions addressed to this department are published here and answered by you, our readers, who are graduates of the School of Hard Knocks and who have their diplomas from the College of Experience. If you don't want our editor's advice or an expert's advice, but just plain, everyday business farmers' advice, send in your question here. We will publish one each week. If you can answer the other fellow's question, please do so, he may answer one of yours some day! Address Experience Pool, care The Business Farmer, Mt. Clemens, Mich.

BREAK COW FROM SUCKING SELF

EDITOR of BUSINESS FARMER: I will give you a recipe to break a cow from sucking her self and it is a sure one as I have tried it. Place a bit in her mouth. In a few days she can eat and drink as well as ever, it will not bother her in any way. Take a strap or a piece of rope and tie around her head and the bit in the cows mouth that puts an end to her sucking her self.—Darius Seltine, Marlette, Mich.

OUR BOOK REVIEW

(Books reviewed under this heading may be secured through The Michigan Business Farmer, and will be promptly shipped by parcel post on receipt of publisher's price stated.)

The book of Noble Dogs.—By Estelle Ross. This is a book for the person who loves dogs. It is rich in anecdote about the dog friends of famous men. It gives the stories of celebrated dogs of history, literature and mythology. It tells of dogs who were friends of kings and the alleged familiar spirits of great magicians and indeed about all the most outstanding dogs that have appeared in prose and poetry. Published by The Century Co., New York City. Price $2.00.

The Farm Cook and Rule Book.—By Nell B. Nichols. This is a cook and rule book of the good old fashioned kind, with recipes modernized to fit present-day conditions, and with all the useful beauty secrets and many points on successful housekeeping included. Published by The MacMillan Company, New York City. Price $2.00.

ing and long-distance transmission.

12. A single-tube receiver capable of operating a loudspeaker on a loop antenna and having less distortion and greater volume than any present multi-tube receiver, will be developed.

DEFOREST INVENTOR OF REGENERATIVE CIRCUITS

A VERY recent court decision has given to Dr. DeForest all the patent rights to the use of vacuum tubes in regenerative circuits. This case was bitterly fought by the people who had bought the Armstrong patent on regenerative circuits, but Dr. DeForest had plenty of evidence to show that he was the first to use and to discover that vacuum tubes could be used in that manner.

So now instead of seeing so many advertisements of receiving sets in which we see "Licensed under the Armstrong Patents" we will hear more of the DeForest name.

It will be recalled that it was Dr. DeForest who invented the vacuum tube in it's present form with three internal elements.

HOW MUCH WATER WILL A TREE DRINK

TO determine how much water is required to bring six different western conifers, in five different types of soil, up to 1 foot in height, experimental studies have just begun at the Fremont Forest Experiment Station laboratory, Mt. Manitou, Colo. For the 5 or 6 years during which the thirty studies involved will be carried on, says the United States Forest Service, the young trees will be kept in containers of a type that will permit the measurement of water loss. Another experiment initiated at the same Experiment Station is designed to test the productive qualities of a great variety of forest soils, and to determine each year the dry weight of tree material that is produced by growth in each soil with a standard amount of water and with light and with temperature conditions carefully equalized.

Still another interesting series of experiments will be carried on to determine with what similarity the different species of a given forest region respond to the stimulus of light, and what qualities of the sun's rays are most effective in tree growth.

Heartless

"Ah," she sighed, "I shall never hear his footsteps again; the step I have listened for with eager ears as he came through the garden gate, the step that has so often thrilled my heart as I heard it on the front porch. Never, never again!"

"Has he left you?" asked the sympathetic friend.

"No. He has taken to wearing rubber soles!"

Frugality, Always

A Scotchman, wishing to know his fate at once, telegraphed a proposal of marriage to the lady of his choice. After spending the entire day at the telegraph office he was finally rewarded late in the evening by an affirmative answer.

"If I were you," suggested the operator, when he delivered the message, I'd think twice before I'd marry a girl that kept me waiting all day for an answer."

"Na, na," retorted the Scot. "The lass who waits for the night rates is the lass for me."—Exchange.

HIGH COWS IN TESTING WORK IN MICHIGAN DURING MAY

The following tables show the 5 high C. T. A. cows in Michigan for the month of May in the respective age classes designated. These are the highest butter fat producers out of 21,032 cows under cow test work in 77 associations reporting. There were 83 associations actively operating during the month and four new associations started making a total of 87 C. T. A in Michigan.

The biggest new thing in balloon tire manufacture today is the sensational cord fabric

SUPERTWIST

developed by Goodyear. Tests show that tires made with this elastic and enduring new material *delivered in excess of 100% greater carcass service* than tires made with an equal number of plies of standard cord fabric. Ply for ply, in other words, SUPERTWIST in these tests literally *doubled* the carcass life of the tire. SUPERTWIST is used only by Goodyear, and is built into Goodyear balloon tires of *both* kinds—to fit new wheels, or the wheels now on your car.

DAIRY and LIVESTOCK

FACTS ABOUT TUBERCULOSIS OF SWINE AND POULTRY

IN the systematic drive to suppress tuberculosis of livestock in the United States some rather unusual methods are in use in addition to the regular procedure. Livestock owners are now rather familiar with the different forms of tuberculin tests, with the accredited-herd plan, and with systematic area work.

Charts Show Need for Research

Records of tuberculin testing have resulted in a great fund of information covering several million animals. This information is used in various ways before it is filed as a part of official records. For instance, the facts and figures are a basis for a wide variety of charts and maps showing the extent of infection in various parts of the country, difficulty in freeing badly infected herds from the disease, comparisons of the various tests used individually and in combination with one another, and numerous other interesting studies. Such charts are virtually "war maps" against the disease and have been valuable in directing experimental work in the most desirable fields and also in conducting field work.

Value of Tattooing Hogs

One of the more recent developments in tuberculosis eradication is the wide use of a tattoo marker for hogs. For years it has been known that swine were susceptable to tuberculosis derived from cattle, as well as from fowls. But the extent to which swine were affected from such sources has been difficult to determine satisfactorily. Necessary studies needed to be made under actual farm conditions, but the difficulty of maintaining the identity of swine from the time they left the farm until their carcasses could be examined by Federal inspectors in some distant packing plant was a serious problem.

Apparently there is a slight relation between the tattooed freak of traveling shows and a porker ready for the market. Yet the plan of tattooing hogs was suggested by the permanence of tattoo markings and has aided greatly in the study of tuberculosis among swine. The tattooing instrument consists of a handle in which phonograph needles can be arranged to form letters and words. A number of tattooing fluids have been tried with the result that several have been found which leave indelible markings even after hogs have gone through the scalding tank, scraping machines, and other packing processes.

To apply the tattoo the operator "inks" the marker and strikes the hog with it gently on the shoulder. The process takes but a moment but plainly indentifies the hog so it can be recognized by a Federal inspector at a distant market.

Example of Practical Use

One of the most comprehensive studies of tuberculosis among swine made with the aid of the tattooing instrument is reported by Dr. J. A. Barger, a Federal inspector stationed in Iowa. For five years, from 1919 to 1923, inclusive, records were kept on "wagon" hogs hauled to a packing company in Waterloo, Iowa. As the name indicates, these hogs were produced within hauling distance of the packing plant. The records covered more than 75,000 hogs, the number being distributed nearly evenly throughout each year of the period.

Beginning in 1919 a great deal of work in eradicating tuberculosis from the cattle in the same territory was conducted, and the disease among cattle has now been reduced to almost a vanishing point. Simultaneously with the eradication of bovine tuberculosis on farms where the wagon hogs originated, there has been a rapid decline in tuberculosis infection among the swine as identified by tattooing markings. For the five years, 1919 to 1923, inclusive, the number of hogs which showed lesions whatever of tuberculosis declined progressively from 37 per cent to 10 per cent. The great majority of these lesions were small, affecting only glands. However, the same general result is seen in condemnations of carcasses which during the same period declined from 1.17 per cent to 0.3 per cent. An instance of this kind shows clearly that eradicating tuberculosis from cattle results in this rapid decline of the disease among hogs.

More recently the Department of Agriculture, cooperating with State officials and packing-house officials, has made numerous studies of tuberculosis of swine in its relation to avian tuberculosis, meaning the form of disease found in poultry.

Remarkable Report from Michigan

A report of unusual interest, made by Dr. T. S. Rich, inspector in charge of tuberculosis work in Michigan, indicates that fowl tuberculosis, if sufficiently prevalent, may cause infection among swine. In Hillsdale county, Michigan, where much tuberculosis eradication has been carried on with cattle, the disease among cattle now exists to the extent of not more than one-half of 1 per cent. Hillsdale county is officially classed as "a modified area" by reason of the suppression of the suppression of bovine tuberculosis to the very small percentage mentioned.

Since the country became a modified area, several thousand swine have been shipped from that county, a surprising percentage of which showed slight lesions of tuberculosis on post-mortem examination in federally inspected establishments. During the period November 6, 1923, to April 2, 1924, shipments of hogs from Hillsdale county, totaling 13,264, were slaughtered at Buffalo under Federal inspection. According to the report of Dr. B. P. Wende, the inspector in charge at Buffalo, 2,219 hogs, or about one-sixth, showed slight evidence of tuberculosis. The lesions were so slight, however, that it was necessary to condemn entirely only one carcass; five others, however, were rather seriously affected.

BULLFROG BETTER MOUSER THAN CAT

If you don't care to take a Kansas bullsnake upon the premises to keep rats and mice away, get a bullfrog.

The mousing proclivities of a bullfrog are vouched for by Wade Fatheree, local sportsman of Chickasha, Okla., who captured a giant hopper on a fishing trip.

Incidentally, the frog secured a safe and steady future at a time when he was headed for the frying pan.

Fatheree tied the critter in the house awaiting execution. During the night the frog broke loose.

"I could hear him hopping about the house and then hear his jaws pop and a mouse squeal. He kept that up throughout the night. The next morning he had the appearance of a swelled up frog. Now he has a home with me" Fatheree declared.

Fatheree says he wouldn't trade the frog for a flock of tom cats.

By the system of tattooing hogs, used by department investigators, the inspectors were able to identify the infected animals coming from 39 farms in Hillsdale county. On 22 of the farms no infection was found among the cattle. On 15 farms bovine infection was traced for a period up to the year 1921, the herds having been free from the disease since that time. On the remaining two farms no cattle were kept.

Continuing their veterinary detective work, the investigators applied the tuberculin test to 15 lots of chickens containing 75 head. Twelve of the 15 lots contained reactors. Tests were also applied to the swine on the farms with the result that 17 and a fraction per cent of swine infection was indicated. This figure checked rather closely to the percentage, 16.8 per cent, as reported through post-mortem inspection by the inspector at Buffalo. In the absence of bovine tuberculosis on the farms where the hogs originated, the tests incriminated tuberculosis fowls as the probable source of infection. The matter is believed to be of interest to poultry owners, stock men, and veterinarians.

Tuberculosis-Free Poultry Flocks

Dr. Rich, who furnished the foregoing information, stated in concluding his report: "It is our judgement that conditions are sufficiently serious to demand a carefully conducted educational campaign through newspaper articles, bulletins, and public talks, stressing the necessity of eradicating tuberculosis from chicken flocks, which will automatically remove this source of infection from swine. The public should be taught the advantages derived in keeping only young fowls, not only from the economic standpoint, but in the elimination of disease carriers as well. The swine breeder should also be induced to keep only known tuberculosis-free breeding stock, through the use of the tuberculin test."

In connection with the Michigan report, it is well for livestock owners to know that tuberculosis of fowls occurs chiefly among the older birds, especially those more than two years old. The most conspicuous symptom is "going light," meaning, as the name indicates, a rapid loss in weight, especially the emaciation of breast muscles. Other symptoms are lameness and ruffled plumage. On post-mortem examination tuberculous fowls usually show whitish, grayish, or yellowish, spots on internal organs, notably the liver. The prompt disposal of old fowls will eliminate most of the tuberculous infection, but when serious on the farm it is advisable to dispose of the entire flock, to disinfect the poultry houses and premises thoroughly, and then introduce new stock known to be healthy. Dead fowls should be burned or buried—never fed to hogs.

Swine Infection from Cattle

One of the most conspicuous cases of swine tuberculosis evidently caused by infected cattle was reported recently by a veterinary inspector stationed at Des Moines, Iowa. A farmer living near Waterloo hauled 35 hogs to a packing company. Twenty-six of the hogs were badly tuberculous and were condemned. Five others were slightly affected. Immediately following the slaughter of the hogs, inspectors tested the cattle on the farm where the hogs originated. Twelve of the 14 animals in the herd reacted to the test; the remaining two were young heifers.

An experience of this kind, when considered in connectioinn with other cases of similar though not so serious infection, points to heavy economic losses traceable to infection of swine from cattle. Scientific and laboratory studies of the different types of tuberculosis have thus far not yielded definite information as to the degree in which the various types of tubercle bacilli affect animals of different species. That is, the degree of virulence and the exact identity of different kinds of bacilli have not been definitely determined. But field reports, such as those presented, appear to show clearly that swine are susceptible to infection both from bovine and fowl sources. In some localities poultry are largely responsible for the infection among swine, whereas in other territories it is reasonable to attribute the infection more largely to tuberculous cattle. Infection may also result from both sources.

The United States Department of Agriculture recognizes that reports such as the foregoings, though extremely interesting from a practical standpoint, lack the conclusive proof which only carefully controlled and long-continued experiments can give. Yet until experimental facts are more fully established the results of these field studies in tuburculosis eradication are presented to caution livestock owners against needless exposure of swine to tuberculosis cattle and poultry.—Dr. J. A. Kierman, Chief, Tuberculosis Eradication Division, Bureau of Animal Industry, U. S. Dept. of Agriculture.

Hereford Breeders Enjoy Two Day "Hike"

THE Michigan Hereford Breeders' Association tour through the west central part of the state was well attended and much enthusiasm was shown throughout the two day trip, June 19th and 20th.

The first day of the tour followed "Feeders Day" at the M. A. C. and went through some of the best beef producing sections of the state in Clinton and Ionia Counties. Most of these farms were typical of the conditions under which beef cattle fit into the general farm program to best advantage.

Early Thursday morning seven cars brough a lively group of Hereford breeders and admirers to the Pino Brothers Stock Farm near Dewitt, where about forty registered animals were rounded up for exhibit. This herd has just been established, most of the cattle having been on the farm only a few weeks.

James R. Campbell, Chairman of the "Hike" committee, then lead us to his own pastures north and west of St. Johns to see his twenty-three head of purebreds. His farm has not been raising whitefaces many years, but the way "Jim" picks out the good ones and rattles off their pedigrees he is surely going to have the older breeders stepping to keep ahead of him.

Jos. Feldpausch's herd of thirty-five, near Fowler, was next visited, where we saw a fine crop of little calves very uniform in age and appearance. The Feldpauschs must have learned to preserve cider before the days of prohibition, for they served the party with a real treat on sweet cider.

Weisgerber Brothers south of Ionia, lead out a fine young bull. Their herd of twenty-five head included some baby-beef calves about ready for the market only a little over a year old.

Part of the Harwood herd, which included some fine heifers, was visited before dinner. But, my memory of them seems rather blotted out by the bounteous dinner on the Harwood lawn. The crowd of more than half a hundred, that had been picking up all the forenoon, was served in a most creditable manner and all certainly appreciated it. County Agent R. L. Helm acted as toastmaster and called upon Mayor Fred Green of Ionia, who gave a snappy and inspiring talk. The "Hereford Song" by the young ladies please everyone. Short talks by G. A. Branaman, who had charge of the calf feeding experiments at M. A. C., W. W. Crapo, President of the Association, and V. A. Freeman, Secretary were enjoyed.

Wm. Kneal & Son showed a fine lot of cows and calves. An informal judging contest and demonstration was entered into by nearly everyone present, and while there was some difference of opinion, everyone agreed that here was a fine place for a new breeder to get in mind the type of Hereford cow most in demand.

Back at the Harwood farm again, the cow herd was seen and also the herd bulls. Their old "Keep On" bull made a fine demonstration of the points to look for in selecting a herd bull. It was hard to break away from this excellent herd, numbering about one hundred and forty.

Mr. J. M. Richmond, of Smyrna, showed thirty-two head, which included the Becker herd recently purchased by him. Some of them had to be routed out of the woods but one old cow in particular was well worth rounding up to see.

The Anderson herd west of Sparta certainly made a pretty picture on the hills of their pasture. They were the only polled herd visited on the "hike", and certainly raised most of the visitors opinions of the progressed made by polled Hereford breeders. The crowd made the cattle nervous so that it was impossible to view them close up, but all agreed it was a fine lot of about sixty, headed by the right kind of a bull.

After enjoying fine accommodations for the night at the new hotel in Fremont, E. J. Taylor, veteran breeder and herdsman, led us back through the woods between two lakes and up the hills to where his uniform herd of line-bred "Anxiety" cows divided their time between pasture and the beautiful scenery. His twenty cows and calves certainly put life and color into one of nature's beauty spots.

The "hike" then proceeded past the Croton Dam, one of the large power Dams of the state, to Howard City for a short visit at the Pennsylvania R. R. Demonstration Farm. Of course, no one expects to raise beef cattle on such a farm, but by the time B. O. Hagerman, Agricultural Agent for the Pennsylvania R. R., had shown us about and explained how they handle the "Keystone Rotation" we were convinced of the value to the surrounding territory of such a demonstration farm.

W. W. Terry, northeast of Remus, had his seven head in the barn waiting for us. Several cars joined in here again just about making up for the loss in attendance when leaving Ionia county. Mr. Terry feels "bully" about the Herefords, because his three foundation cows have brought him only one heifer in three years, and he says he will increase his herd if he gets a change of luck and some heifer calves.

George Wheeler took the lead to his pasture southwest of Mt. Pleasant and showed us a fine start of twenty head. George has been going hardly two years with whitefaces but his calf crop speaks well both for the care they receive and for the kind of parents he selected for them.

The last stop was made with A. J. Hamlin, of Shepherd. A long distance view showed some good thick cows eager to find their calves and get away from our intruding party. As the hour was late and many of the cars faced long drives home, parting hand shakes prevailed and we only saw part of his herd of thirty.

Remarks on all sides praised the work of the committee in charge of the "hike" for their good work in planning the details of the trip. The committee consisted of Jas. R. Campbell, St. Johns, Jay Harwood, Ionia, E. J. Taylor, Fremont, and Geo. R. Wheeler, Mt. Pleasant, and they certainly appreciated the hearty cooperation of all the breeders homes, all added much and were appreciated by the touring party. After touring different parts of the state one is forced to the conclusion that hereford breeders are good feeders, and good natured like the cattle they produce. This tour certainly brought them closer together in many ways that leads to friendship, cooperation, and more unity in the improvement of their favorite breed of cattle. Just join the next "Hereford Hike" if you want to meet good fellows, see good cattle, learn good methods of keeping them, and have a good time.

TREATMENT FOR GARGET

I have a cow that has Garget. She was all right while I fed grains now I am feeding clover hay. She is coming in the last of August. What can I do for her?—C. G. D.

THERE is no specific treatment for garget. A line of treatment that works well on one patient very often does not do any good to another similarly affected. The affected quarters should be milked out five or six times daily. The milking should be done into a pail containing a disinfectant solution. Massaging the affected quarters three times daily with soap liniment (U. S. P.), seven parts, and fluid extract of phytolacco, one part, sometimes works well. Internally the administration of one to one and one-half pounds of glober salts in a quart of water should be given as a drench and followed by giving one-half ounce of fluid extract of phytolacco night and morning for two or three days.—John P. Hutton, Associate Prof. of Surg. & Med., M. A. C.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

Wooden shoes

"THE peasants in America do not wear wooden shoes at all, even in the fields!" writes Abbe Pierre, of Gascony. "No, the peasants there wear shoes of leather, although I should think that sabots would be much more serviceable, not only on the roads, but plowing. . . . And wooden shoes are far less expensive. Ah, that America is an extravagant country!"

Advertisements haven't yet taken the heavy wooden shoes from Gascon feet—nor yet the heavy wooden shoes from Gascon minds. Gascony thinks in the past. America in the future.

Advertisements make the difference. They crisscross improvements in countless directions across the miles. They distribute Fords, furnaces and electric lights so widely that foreigners think you extravagant to enjoy them. They put you in touch with the latest conveniences. They help so many people enjoy those conveniences that their cost to you is small.

You read the advertisements to link yourself with the best—to substitute speed for the shambling progress you otherwise would have to make in the lonely wooden shoes of isolation.

Do you read them regularly? Good habits pay.

FOREMAN URGES GRADING OF EGGS

EGG producers of Michigan must learn to grade their product if they expect to continue to compete with poultrymen of other states on the leading markets, declares Prof. E. C. Foreman, head of the poultry department of M. A. C.

Buyers' egg grades were recently put forth by the United States Department of Agriculture in an effort to simplify egg standards and to facilitate trading on a uniform basis between producers and country buyers. Farmers who grade their eggs according to these standards can command higher prices, he asserts, provided their product is of good quality.

"The old idea has been that anything with a shell around it is an egg," said Prof. Foreman. "But the public has preference for certain kinds of eggs and it is willing to pay a premium for them. The Atlantic Coast Poultry Producers' Association regularly grades the eggs it sells on the New York market. Its news letter the other day showed a difference of 12 cents between the white extras, which sold at 36 cents, and brown pullets, which sold at 24 cents. Other grades ranged between.

In the Government standards, only two grades are provided for sound shell eggs. Grade No. 1 consists of eggs of an average weight of 24 ounces net per dozen with a minimum weight at the rate of 22 ounces per dozen for individual eggs. The shell must be practically clean and sound; the air cell must be of a depth of 3-8 inch or less, localized, and may be slightly tremulous; the yolk may be visible and mobile, the white reasonably firm, and the development of the germ slightly visible.

Grade No. 2 consists of eggs of an average weight of 22 ounces net per dozen with a minimum weight at the rate of 18 ounces per dozen for individual eggs; the shell clean or dirty, but sound; the air cell having a depth of over 3-8 inch, and bubbly or freely mobile; the yolk plainly visible and freely mobile; the white weak and wattery, and the germ development clearly visible, but with no blood showing.

The services of county agents and extension agencies generally over the country are being enlisted in the campaign to bring about the marketing of eggs according to quality. It is believed that the grades for eggs used by the wholesale trade in terminal markets are too complicated for use at country points, hence a set of simple buying grades has been proposed by the department. When buyers pay prices for eggs based on quality, an incentive is immediately offered producers to produce and market eggs for the higher qualities, the department says.

CARE OF POULTRY IN AUGUST

OF course, chickens require more care and attention while they are still in the brooder than at any other time during their lives, and yet, when they have outgrown this first stage in their development, they can not profitably be left to shift for themselves. To insure well developed birds, they must be provided with plenty of fresh water, shade, a well balanced ration, comfortable quarters, and plenty of room on the roosts. Lacking any of these essentials, the result is very likely to be stunted fowls, poorly developed.

Fresh air and clean water are two necessities that many flocks do not get enough of; and the only excuse is carelessness. Plenty of fresh air increases the vigor and "pep" of a flock to a surprising amount. Colony houses should be provided with one side at least partly open. It is always a safe rule to have enough open space on the south side of the poultry house or brooder house to equal one-fourth of the floor space. But be sure to have the open space on but one side, as otherwise the danger from drafts is increased. Hinged windows may be on other sides, but it is essential that they be arranged so that they can be shut down during damp or chilly weather.

Water should be kept before the fowls at all times, and it should be cool and fresh, in sanitary vessels. If the fowls are forced to do without water for a while, and then given plenty, they are likely to drink enough to injure themselves.

We always place low roosts in the colony house when the chicks are six weeks old. When this is done they learn to roost of their own accord.

Shade is necessary and if there is none present, sunflowers planted to the south and west of the yard will grow quickly and not only furnish shade but later on will prove excellent feed for the fowls.

August is one of the worst, if not the worst, months for filth and lice. Every crack, corner and crevice, as well as the dropping boards, should be sprayed at least twice a week, with a strong dip or other disinfect. After disinfecting, sprinkle the corners well with slaked lime. Keep the dropping-boards well cleaned, and the house and litter as clean as possible.

It is also advisable to use louse powder in the dusting boxes. Lice are very annoying and should not be tolerated, when they may be eradicated with a small expenditure of time and money.—Farm and Ranch.

DON'T NEGLECT NEEDS OF LAYERS

NEGLECTING the needs of the layers at any season means a loss of profit—and profit is the thing that keeps most poultry enthusiasts in the business. It is necessary that the hens go into the molt in good shape, if they are to be ready for heavy fall and winter egg production.

Just because water is cheaper than food is no reason to think it is not so important. When you consider the fact that 80 per cent of an egg white is water and 52 per cent of an egg yolk is water, you realize how important it is that hens are at all times supplied with plenty of fresh water. It is not enough to allow the fowls access to some pool or pond of stagnant water, as is so often done on farms where poultry is merely kept as a sideline. Unless the water is fresh and clean, the birds will not drink the required amount, and a slump in egg production will be the result. The number of eggs laid can quickly be cut in half by careless attention of the attendant, as regards watering.

I believe one of the most common causes of low egg production in farm flocks during the summer months is lack of protein and a good mash. I have heard several poultry owners remark that during the summer, when the fowls are allowed plenty of free range, they do not try to feed a balanced ration, as they consider that with access to the various elements needed for egg production, the fowls will balance their own ration. They claim that Nature will so regulate the bird's appetite that she will—given the desired choice of grains, green feed, and insect life—select such feed as would constitute a perfectly balanced ration. I have experimented much along this line, but common sense is all that is needed to tell us that a fowl fed in the above manner will only eat such foods as are needed to keep her in good health and enable her to lay a setting of eggs in the spring—her natural laying season. Nature unaided does not demand that hens or any other fowls lay through the entire year, except for a brief vacation at molting time. And if we are expecting or desiring such production, it is up to us to induce the birds to consume such food as is required for this work.

Appetites Differ

Repeated experiments have proved to me that the appetites of individual hens differ quite as much as do the appetites of humans. While most hens are fond of corn, others will pass it for wheat. I have found that almost invariably, when a hen is allowed to balance her own ration, she eats enough corn and other fat-producing foods to make herself overfat. And a hen cannot lay in an overfat condition. For that reason, it is quite as important to feed a properly balanced ration of grains and mash in the summer as in the winter. Although the birds will be sure to pick up bugs, worms, and insects during warm weather, when they are allowed on free range, it is not at all probable that they will consume enough animal protein in this way to make it unnecessary to feed milk, meatscraps or tankage.

Too much tankage is quite as harmful as too little tankage, so it is necessary to use common sense in feeding it. We always use tankage instead of meatscraps, as it is cheaper, and it always pays to note what per cent of the tankage is protein. This varies quite widely in different brands. When our flock is allowed plenty of range, we cut down 50 per cent on account of tankage fed, during the summer. But we always feed milk when we can spare it regardless of the season, as this feed is so rich in vitamines, and vitamines are so necessary to the health of poultry. Of course, green foods also contain vitamines, but in such small amounts that the fowls cannot eat enough green matter to furnish the required amount of the all-important vitamines.

TURKEY RAISING ON THE DECLINE

TURKEY raising in the United States has been on the decline during the last 20 years especially as an enterprise on the general farms of the country. Formerly large numbers were raised in New England, but in recent years there has been a decided decrease in this section as well as in all other parts of the country. Several causes have been assigned by the United States Department of Agriculture for the decrease in the numbers now raised. The rearing of the young stock, in some respects at least, requires more detailed attention than is the case with most other classes of poultry and turkeys have given way to these other classes. The prevalence of blackhead has been a dominent factor and responsible for the discouragement of many raisers. The birds range widely and frequently trespass upon the property of neighbors, the vexation tending to discourage turkey raising. Finally, little attention has been given the more important problems of the industry by investigators.

On the other hand, there is, according to the United States Department of Agriculture, good opportunity for further development. Turkey raising is profitable, particularly where conditions are suitable and where proper methods of management are followed. The department has issued a new bulletin on turkey raising, Farmers' Bulletin 1409, which discusses the important points of the business and offers suggestions for making the industry a more profitable enterprise.

The bulletin sums up some of these fundamental factors as follows:

To be successful in turkey raising, one must give the most careful consideration to certain fundamental factors. The turkeys, especially the growing stock, must be kept under the best possible conditions.

Free range seems indispensible, although there are a few who have made a success in raising turkeys in confinement. A more thorough test of this method is necessary, however, before it can be advocated. Certainly abundance of free range on clean soil is greatly to be preferred. Every effort should be made to keep the soil sweet and clean. This is particularly true of the ground on which the birds are fed and where they roost.

Another fundamental essential is to keep healthy and vigorous breeding stock in the best possible breeding condition. The breeding birds should get plenty of exercise and should not be fed too heavily on fattening rations. The great difficulty is to get stock that is free from blackhead, but one can at least select breeding stock based on constitutional vigor. By breeding from the most vigorous birds every year, a flock of healthy birds may be developed and maintained. Certainly much more care should be exercised in the selection of male breeders each year.

Both old and young turkeys should be protected from dampness. In sections of the country where dampness is prevalent or where rainstorms are frequent the birds should be provided with suitable protection.

It is very important not to feed the poults too heavily, especially the first few weeks. Keep them just a little hungry.

A copy of this bulletin may be secured, as long as the supply lasts, from the United States Department of Agriculture, Washington, D. C.

No Peddling For Muskegon Farmers

(Continued from Page 4)

Practically all troubles arising from poor quality products have come from stuff sold by hucksters who had slipped on to the market or from producers who were only occasional users of the market. The farmer who uses the market regularly and who depends on it as an outlet for his produce, knows the importance of satisfying and pleasing his customers.

Future of Markets

It must be admitted that there is still much peddling of produce being carried on in Greater Muskegon. However this form of marketing is growing less each year and it is reasonable to suppose that soon we shall see it confined to three classes only, these being: first, the farmer with a large load of one product only, the same being too large a quantity for the market to absorb in one day; second, the farmer who has developed a private trade for his own special products; third, the farmer who would rather spend a day in puttering around with peddling rather than to spend 25 cents for a market stall.

It is quite probable also that a wholesale market will, in time, develop in connection with the retail markets. Such a market would take care of the farmers who have large quantities to sell and who want to sell their entire loads in one transaction. At the present time many merchants come on the market to buy for their stores but no definite wholesale market has been established.

The main benefit of the market will continue to come to the farmer who uses it steadily, building up his own clientele of satisfied customers. Such a farmer fares best when he comes on the market with a small quantiy of each of a number of different kinds of products. A load composed of a variety of produce is more quickly disposed of, and it is easier to hold customers when they can fill most of their needs at one stall.

The lesson of quality in marketing is being learned thoroughly by the farmers on Muskegon's markets and there is no doubt but that offerings of greater quality will be the result.

Opposition to the market still comes from some short sighted merchants who have seen their trade in farm produce somewhat reduced. It is unfortunate that such merchants do not have the vision to see the greater benefits accruing to the town, and hence to themselves also, through the trade secured from those who the market brings to Muskegon to dispose of their produce. Some opposition also comes from a few of the hucksters as a result of being barred from the market. Opposition from both of these sources will probably lessen with time.

While it may be a long way from fullfillment, the greatest present need of Muskegon's markets is for a covering to shelter both salesman and buyer during inclement weather. But no matter what the weather, both producers and consumers come on the market days and thus, rain or shine, the city markets of Muskegon are rendering a distinctly valuable service to both the city and the surrounding country.

Important News about the Value of Fertility

1. Authorities have estimated that from ⅓ to ½ of all our barnyard manure is absolutely wasted, the annual loss totaling about $800,000,000. This loss is not alone on poorly managed farms but it includes many that in other respects are operated efficiently.

2. A Nebraska farmer reports this result of an experiment in manure spreading over a 3-year period—

Six acres, manure *spread by hand from a wagon box,* average number of bushels of corn raised per year: 336.

Six acres, manure *spread evenly by a manure spreader,* average number of bushels of corn raised per year: 420.

Three-year gain in bushels of corn, by the use of a good manure spreader, on the 6-acre area: 252.

3. McCormick-Deering manure spreaders put fertility into the soil as it should be done. They are light in draft, strong and simple, yet with the right adjustments so that you can spread all kinds of manure, as heavy or light as you need it.

Note these features:

1. Auto Steer. 2. Front Wheels Track with Rear. 3. Two All-Steel Beaters. 4. Wide-Spread Spiral. 5. Narrow Tread. 6. Self-Aligning Bearings. 7. Steel Main Frame. 8. Six Feed Speeds. 9. Positive Apron Drive.

Built in two sizes to fit small or large farms. See the spreader and its practical features at the store of your McCormick-Deering dealer.

MARKET FLASHES

MARKET SUMMARY

All grain markets are firm after recent gains. Beans firm. Potatoes easy. Best hens scarce and firm, but supply of broilers is heavy and market weak. Receipts of dressed calves small and market firm. Cattle unchanged. Hogs active and prices higher. Sheep steady.

(Note: The above summarized information was received AFTER the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press.—Editor.)

FOOTE'S MARKET LETTER

BY W. W. FOOTE

Farmers' Outlook

ALL the present indications point to higher prices for farm products for the new crop year, due to promised smaller crops. According to the Department of Agriculture, wheat grown last year on 7852 farms cost on an average $1.24 a bushel and had a sales value of 99 cents a bushel; while corn raised on 11,238 farms cost 68 cents a bushel, with a sales value of 81 cents. Oats on 8481 farms cost 52 cents a bushel, with a sales value of 49 cents. Potato growers in different parts of the country showed margins of between average cost and average selling value of from $1.42 to $86.23 an acre. It is practically certain that the aggregate wheat crop of the country will be so much smaller that farmers will be in a position to obtain much higher prices than those paid for the crop of 1923, while the corn outlook is for such a large decrease in production as to put prices much higher than those paid for last year's crop. Already substantial advances have been paid for the several grains, and fear of a small yield of corn has brought about much smaller marketing of remaining supplies of surplus corn throughout the corn belt. Widespread interest is felt in the outlook for hogs, most of the middle western farmers owning swine, and the most reliable information is furnished by the Department of Agriculture, a decrease of about 8,000,000 hogs in the spring pig crop in the corn belt indicated. It shows that the high point was reached in the spring pig crop of 1923, while it began to go down in the last fall and is now rapidly receding and has about touched a normal level. A decrease of about 21 per cent in the number of hogs farrowed this spring compared with the spring of 1923 is shown by the survey. Altogether, it looks like much better times for hogs after the hogs now maturing are marketed. Cattle are plentiful in feeding districts, and it has been impossible to maintain prices for well fattened steers and heifers at the scale of earlier months of the years; but in all probability stockmen will continue to find the industry a profitable one when conducted right, it being a mistake to market cattle which have been poorly fed. A prosperous future is promised for the sheep and wool industry although lambs have had a seasonable decline from prices pair for spring lambs at the opening of the season.

July Crop Report

An unusually poor crop of corn is indicated by the government July crop report, the harvest being placed at 2,515,000,000 bushels, comparing with 3,046,000,000 bushels raised in 1923. The crop promises to be the smallest grown since 1918, when 2,502,000,000 bushels were raised. The indicated wheat crop is 740,000,000 bushels, and is 47,000,000 bushels above the June estimate, and 46,000,000 bushels less than last year's yield. The winter wheat crop is estimated at 543,000,000 bushels, being 29,000,000 bushels less than that of 1923; while the spring wheat crop is estimated at 197,000,000 bushels, being 16,000,000 bushels less than last year. The oats crop is estimated at 1,356,000,000 bushels, being 56,000,000 bushels more than last year and the largest yield since 1920. A rye crop of 65,000,000 bushel is indicated, showing a gain of 2,000,000 bushels over last year; while a barley crop of 170,000,000 bushels is 28,000,000 bushels less than that of 1923. The hay crop is placed at 90,100,000 tons, being 1,000,000 tons more than last year's. The flax crop is estimated at 25,900,000 bushels, the best grown in recent years and 8,500,00 bushels above that of 1923.

Wheat Sells Higher

A weather market is on in wheat, and rapid price changes are probable, but no one looks for any marked decline. The upward movement has been maintained, and prices are much higher than in recent years. The new crop of winter wheat is reaching liberal proportions, and fairly large exports are reported. For the next three and a half months the United States will be the only large source for wheat for importing countries, and it seems probable that a strong bullish incentive will result from a marked revival of export buying. July wheat sells on the Chicago Board of Trade around $1.17, comparing with 99½ cents a year ago; while July oats sell at 54 cents, comparing with 39 cents last year. July rye is up to 80 cents, comparing with 62½ cents a year ago. According to the Department of Agriculture, there is a shortage of 160,000,000 bushels of wheat in crops of seven countries as compared with last year.

The Boom in Corn

The bad crop outlook has resulted in corn advancing to the highest level of the season, corn for July delivery selling up to $1.05 per bushel, comparing with 83½ cents a year ago, while two years ago sales were made as low as 61 cents. Cash lots of No. 2 yellow corn sell in Chicago as high as $1.07½. The advance in corn is causing premature marketing of hogs, and prospective scarcity of hogs later is causing increased buying of provisions, which are higher than a year ago. Exports of corn, which were fairly large a year ago, have nearly ceased. Oats are selling much higher than in recent years, and two years ago July oats sold as low as 34 cents. Rye prices have had a boom, with good export buying. Regarding feeds, the Department of Agriculture says: "Feed prices held firm, mainly as a result of strong grain markets. The jobbing and speculative demand was good but the consumptive demand was of little consequence in most sections. Rather heavy sticks of dairy products, excellent pastures, and unsatisfactory milk prices tended to light purchases by feeders and dairymen. Production and stocks of most feeds were good. Storage stocks of feed were exceptionally heavy for this season of the year."

Decreased Pig Crop

A decrease of 20 per cent in the number of spring pigs as compared with a year ago is shown by returns from the special pig survey recently compiled by the department of agriculture in cooperation with the postal department. For the corn belt the number shows a reduction of 17 per cent, while in Illinois there is a decrease of 20 per cent.

If Illinois farmers carry out their present plans the reduction in the fall pig crop will also be heavy. Reports indicate there will be 18 per cent fewer sows bred to farrow this fall than actually farrowed last fall. The reported intentions for the corn belt states indicate a 11 per cent decrease, and for the United States a 6 per cent decrease in fall farrowings.

Indications are that the number of hogs in the United States will drop to the average of 1919-21, and may go below that figure unless there is a marked improvement in the corn-hog price ratio. During the last two years the number of hogs marketed has agreed with the size of the pig crop previously indicated by the number of sows reported farrowed in the pig survey.

Irregular Cattle Marketings

Plenty of cattle are held in feeding districts generally, and advancing prices for corn cause increasing marketings of grassy and short fed cattle in Chicago, with fully half of the or more weeks supplies received on Monday. Receipts of 29,591 cattle in that market on Monday last week smashed prices for the principal part of the offerings, but much of the decline was regained later because of much smaller supplies. Recent sales of beef steers took place largely at $8.25 to $10.10, with the best heavy steers salable at $10 to $11 and the best yearlings offered taken at $9.25 to $10.25, and sales all the way down to $7 to $8 for the commoner light steers, these being competed for by country buyers in search of thin steers for fattening. Butcher stock is having a good outlet, but grassy lots are discriminated against and sell at a big discount. Butcher cows and heifers sell at $3.50 to $9.50, canner and cutter cows at $2.60 to $3.45, bulls at $4 to $7.75 and calves at $5.50 to $11.50. Only moderate business is transacted in stockers and feeders at $4.25 to $8.10, largely at $5.75 to $7.50. Combined receipts of cattle for the year to late date amount to 6,395,000 head, comparing with 6,462,000 one year ago and 6,109,000 two years ago. A year ago beef steers sold at $6.50 to $11.50.

The Bean Crop Outlook

The Bean Bag and Pea Journal says that indications for the entire country are that a normal or slightly increased bean acreage will be planted this year. And Michigan—probably above normal acreage, say many, though perhaps not quite up to last year's plantings. That remains to be seen. A cold, late spring has caused many growers to plant beans in place of other crops, notably sugar beets and rye. Even with low prices the last year, growers figure their return from beans is equal to or grater than from many other Michigan crops. They're easy to raise, and bring in the money when it's most needed. From the growers' standpoint it is the actual return in dollars and cents that counts. It is interesting to find that some farmers who have grown Robust beans for two years are not planting them this year and many who tried them last season will not plant them this season. This indicates that many growers are convinced that the Robust iis not the most suitable variety of white beans for our locality. This may not necessarily be true for counties farther south.

The Butter Market

The United States Department of Agriculture states that production reports which at this time of year and for the next two months are such an important factor, were conflicting. Reports on crop and weather conditions quite generally agree that conditions are ideal for a heavy production of butter. Feed is reported plentiful and pastures in nearly all sections are good. The cool weather has greatly retarded the usual fly crop but in some south-western states complaints are beginning to come in. The dampness has been very favorable for hatching mosquitoes and in some sections they are quite plentiful. On the whole, however, production is holding up very well.

Hogs Have an Advance

At last hogs are moving upward, with a greatly improved local and shipping demand in the Chicago market, receipts being smaller than a year ago. A short time ago hogs sold at $6.50 to $7.70, comparing with $6 to $7.30 a week earlier and $5.75 to $6.75 a year ago. Further advances are expected. Combined receipts in twenty markets for the year to late aggregate 24,081,000 hogs, comparing with 23,212,000 a year ago and 18,092,000 two years ago.

Lamb Market Glutted

Unusually heavy supplies of lambs have glutted the Chicago market, and prices are much lower, with sales at $8.50 to $14.00 per 100 pounds. Feeding lambs sell at $11 to $12 and breeding ewes at $6 to $10.75.

WHEAT

Active foreign demand gave the wheat market great strength last week and prices on all markets are higher. At Detroit prices gained 1 cent over two weeks ago. Europe is taking grain in large quantities seeming anxious to not only supply present needs but to store some for future use. Crop reports in this country show our new crop in fine condition and where they have threshed the yield has been above expectations. Other countries where wheat is grown on a large scale report their crop under normal; in fact, foreign crop reports are helping to bull the market.

CORN

It is in the Detroit corn market that prices have gained. Since our last issue prices have advanced a total of 12 cents. The market is in a bullish condition caused by the government crop report which gives the condition of the crop on July 1st as the lowest in the history of the country.

OATS

Oats at Detroit followed the trend of wheat and corn and prices are slightly higher. Offerings have been small.

RYE

Rye also gained strength with the other grains and the price advanced. The market is firm.

BEANS

Demand is somewhat better in the bean market and prices have advanced at some points. At Detroit the price gained 15 and 20 cents last week and a firm tone prevails in all trading. Offerings are light.

POTATOES

Trading is slow in the potato market and a weak tone prevails. Markets report receipts heavy and there is much variation in quality of shipments from all quarters. Some lots have been damaged more or less by rain while others have been affected by hot weather. Old potatoes are about done for and prices are no longer necessary. The condition of the new crop on July 1st was about the same as for the same date a year ago.

MARKET QUOTATIONS

Wheat

Detroit—Cash No. 2 red, $1.21; No. 2 white, $1.23; No. 2 mixed, $1.22.

Chicago—Cash No. 2 hard, $1.20.

Prices one year ago—Detroit, Cash No. 2 red, No. 2 white, and No. 2 mixed, $1.12½.

CELERY — Kalamazoo, $1.25@1.50 per case of 6 dozen.

PRITCHARD'S
WEATHER
FORECAST
INTERPRETED BY THE STARS

Week of July 20

DURING the first couple of days of this week the weather in Michigan may be expected to be generally fair with moderate breezes. Along about Tuesday or Wednesday there may be a reaction to storminess of summer storms with some rain and thunder. However, this condition will soon pass and until near the close of the week the sky will be clear. At the tail end of this week the barometer will fall, cloudiness increase and there will be numerous thunder storms and more or less heavy rains. The temperatures during the last half of the week will rise rapidly reaching the high point about Friday or Saturday.

Week of July 27

Sunshiny days and clear nights are expected in this state during early part of this week. Tuesday or Wednesday will be the warmest days of the week in Michigan. During the middle part of the week there will be more or less tendency towards showers of rain and electrical storms. Following this storm activity readers of this forecast may expect a cool spell in which temperatures will fall below the seasonal normal. The evenings and early mornings, especially, will be cool.

Forecasting Temperatures

We are doing what no other forecaster attempts when we forecast the degree of heat or cold for any certain period and we are right in the majority of cases. During the week of June 22nd we forecast 80 degree readings and at the end of the week 55 and 60 degree temperatures. These came out correct. The high winds and electrical storm for end of week were also correctly told while the severe tornado that took over 100 lives was only a few miles from Michigan. These forecasts are a wonderful advantage to the farmer who plans his work ahead and this department is ready to cooperate to any reasonable extent in advising regarding planting, growing, storing, and shipping of farm crops or cattle. A two-cent stamp will do the trick.

MICHIGAN'S "BLUE SKY" LAW IS GOOD, BUT BEWARE!

(Continued from Page 3)

ise almost anything through the mails if they do not misrepresent an existing fact. When they get too reckless, the federal authorities bring them to time. It will be remembered that Dr. Cook and his crowd got too bold in their dealings in Texas oil. They next began operations in California, but being chased out of there, have now established their headquarters in Mexico.

"There has been a measure pending in Congress for the last two sessions which if passed would virtually remove the cloak of interstate commerce from the mails and allow us to effectually prevent misleading solicitation by mail. This proposal was lost in the filibuster in the Senate last session. When it is passed the Michigan law will dovetail into it and afford complete regulation and protection."

From time to time I had read various statements in the papers showing that swindling promoters annually steal from the unsuspecting American investing public all the way from $400,000,000 to $1,000,000,000. I asked Mr. Duff what was his idea of the amount of the annual loss.

Losses Not Reported

"All these figures are only guesses. Nobody knows exactly how much is lost through unsatisfactory investment deals. There is a good deal of psychology in connection with this situation. The average human being thinks he is smarter than the securities commission when he buys "phony" stock. If he gets stung he usually keeps quiet. Probably he doesn't even tell his wife of his loss for a year or so. This situation makes it absolutely impossible to give even an approximation of the losses sustained through unfortunate stock speculations in Michigan."

What the Act Provides

I had heard so much about the "Blue Sky" law which Mr. Duff seemed to feel was working so satisfactorily that I felt I should know more about it, so I asked him what were its distinctive provisions and whether or not there were any teeth in it.

"The principal features of our Michigan law are that we not only examine the securities which are proposed for sale and the methods of disposal and the terms of sale, but we have complete and effective control of both the dealers and salesmen through a system of revocable licenses," replied Mr. Duff. "The Michigan law is the only one which examines brokerage offices' fees and charges to see that they are not extortionate.

"Our old law quite effectually controled the promoter. The big feature is being copied by other states. Through our National Association of Security Commissions we have a 'black list' so it is very hard for a salesman who gets in trouble in one state to obtain a license in another state. Under the old law there were in Michigan about 9,000 stock salesmen and 3,000 brokers or dealers. There are now but 2,200 salesmen and less than 300 dealers.

The Men in Charge

"The commission which administers this law is composed of a full time member who serves as chairman, and two of the elective state officials to be selected by the Governor. The present members are Hugh A. McPherson, Commissioner of Banking, and Andrew B. Dougherty, Attorney General, and myself.

"The full commission meets every Monday for a two or three hour session. There are usually twelve or fifteen cases to be disposed of. All of these proposed issues must have first received my preliminary approval before being presented to the other commissioners. If there are any patent changes involved the matter must first be passed upon by an expert engineer. Perhaps three months' work has been put in on a case before it finally reaches the full commission.

Need for More Understanding

"As I said before, we are finding the new Michigan law very satisfactory. It is now our paramount desire to so educate the investing public that they may obtain the full benefit of the law's protection. To this end, we are now arranging with Mr. Thomas Johnson, Superintendent of Public Instruction, to publish a booklet to the school children to educate them along the lines of safe investment. We also send the bankers monthly lists of approved stock."

I left Mr. Duff's office feeling that our half hour conference had been extremely enlightening and interesting to me. Here is a great service which the state is rendering to the public and which is all too little understood and appreciated.

Truly, it is just as essential to conserve capital as it is to create it. The person who earns and saves should be permitted to invest with safety.

MARL DIGGING TEST IN LIVINGSTON

THE first of a series of 38 marl digging demonstrations to be staged under the direction of the Michigan Agricultural College was held Thursday, July 10, at Trophy lake, near Hartland in Livingston county.

The idea of the demonstrations is to show the farmers of the state how marl can be taken from lake beds more economically than any other processes and used for fertilizer in place of lime.

THE VILLAGE BLACKSMITH

(1924 Model)

UNDER an ad for gasoline
The village smithy stands;
He's agent for the Jinx machine
And several other brands.
He hasn't shod a horse for years,
For fear he'd soil his hands.

He wears a gold watch on his wrist,
A pearl pin in his tie,
His links are made of amethyst,
The finest he could buy.
There's not a thing the smithy wears
That doesn't please the eye.

Week in, week out, from morn till night
He sees the autos come
With brakes that are not working right
And axles on the bum.
With gas, repairs and grease and oil
He makes a tidy sum.

He has a staff of skilful men
That number twenty-four,
Who toil from six a. m. till ten
And sometimes even more.
The smithy never does a stroke—
He think's that work's a bore.

The children coming home from school
Look in at the open door,
And laugh to see the some city fool
Set up an awful roar
When called to pay some whopping bill
The smith has soaked him for.

He goes on Sunday to his kirk
His mind quite free from cares,
Because his men are hard at work
With punctures and repairs.
And if the weather's fine and warm
The smith says grateful prayers.

Oiling, refilling, repairing,
Onward through life he goes.
And never once despairing
So long as his income grows.
Each night the thought of someone done
Augments his sweet repose.

Highway Danger!

Harold Crandall, who lives on a farm a few miles from Howell, while driving toward Howell on May 17, saw a runaway team coming toward him. He drove to the right side of the highway and stopped. One of the horses attempted to pass on the right side and the other on the left side, the wagon tongue going through the radiator and front of the car, just missing Mr. Crandall, who was riding alone. The horses broke loose, leaving the car badly wrecked.

A Timely Warning

Do not drive without automobile insurance. Highway risks are becoming greater each year. You can insure in a well established company at reasonable rates.

STATEMENT as of July 1, 1924

LIQUID ASSETS		
Cash and bonds	$495,072.63	
Accts. Receivable	15,006.63	
Office Building	27,727.44	
Total Assets		$ 537,806.70
Legal Reserve (40%)	$406,464.63	
Reserve for Pending Claims	81,000.00	
Surplus for Contingent Losses	50,342.07	
Net Premiums and Income from July 1, 1923 to July 1, 1924		$1,016,161.56
Claims paid first six months of 1924		$ 222,021.73
Claims paid since organization		$1,886,141.83

Why not do the sensible thing and call upon our nearest agent and insure today? The company is now in its [illegible] season of success. All fair claims are paid promptly; unresonable claims are defended. Keep insured and slow down in heavy traffic.

SPECIAL DAY AT M. A. C. FOR GARDENERS

MARKET gardeners will gather at the M. A. C. Wednesday, August 20, to stage "Market Gardeners' Field Day" and a program of value to those interested in the production of vegetables, commercially or otherwise, will be presented. According to Prof. Geo. Starr, of the M. A. C. horticultural department the day will be made an annual event.

The forenoon is to be devoted to a tour of inspection over the gardens of the college horticultural department, together with the exhibition and explanation of various projects now under way. Included among these projects is a comprehensive test of extra early varieties of tomatoes, showing by comparison the most profitable one for the Michigan grower; a comparative test of extra early sweet corn varieties; a number of plant breeding experiments which bear on the problems of the truck gardener; experimental work on truck crop fertilization, and new improved strains which are being grown for increase.

Following the basket picnic at noon, at 1:30 the visitors will assemble in the lecture room of the Horticulture Building, where short talks will be given by Profs. V. R. Gardner, R. E. Loree, G. E. Starr and J. W. Crist, on subjects pertaining to the occasion.

A tour of the M. A. C. campus and the college farms will wind up the day's program.

MICHIGAN'S 1924 BEET ACREAGE UP 43,000

AN increase of 43,000 in the acreage of sugar beets planted in Michigan this year is shown in a United States Department of Agriculture bulletin issued by Verne H. Church, Federal statistician for Michigan. The acreage in 1923 was 131,000 as compared with 174,000 this year.

The report states that the condition of the crop in this state is 88 as compared with a 10-year average of 86.4, and the production promises to be 1,233,000 tons as compared with 883,000 tons last year.

The production for the United States is forecast at 7,344,000 tons, with a total increase in acreage from 732,000 to 917,000. The amount of sugar to be made in the United States this year is estimated at 939,000 tons. The 1924 contracts, according to the report, provide for prices from $5.50 to $7 a ton, depending upon the locality.

STATE FARMERS SAVE $2,000,000

THE American Farm Bureau Federation has taken such an active and leading part in the fight against the "Pittsburgh Plus" practice because the farmer is the greatest consumer of rolled steel in the country.

James R. Howard, former president of the Farm Bureau, testified in the hearings before the commission that the average farmer uses a total of more than a ton of steel each year. According to Mr. Howard's testimony, which was based on figures supplied by the Research Department of the American Farm Bureau Federation, farmers paid between $25,000,000 and $30,000,000 each year for phantom freight.

As findings of the commission show, this practice took an unearned toll of more than $30,000,000 from the farmers of 11 States, and probably twice as much from the farmers of the entire country. It cost Michigan farmers $2,000,000 annually in extra freight bills.

It did other things to the farmers. It cramped industrial development in the steel industry throughout the country, except in Pittsburgh and its neighborhood. As a result, hundreds of towns which had many advantages for steel fabrication were unable to utilize these advantages.

Farmers realize that a large consuming population near home helps in the sale and stabilization of price and farm products. Locations advantageous for the steel industry were denied their advantages by the "Pittsburgh Plus" system and because of this, farmers in the vicinity of such location who should have had an assured and stable market near at hand, were compelled to send their products a great distance and to remain dependent upon a distant and speculative market.

Besides, the farmer, as a taxpayer, was actually affected. The former superintendent of highways of Illinois estimated that 16½ tons of steel are used in every mile of hard roads in that state, for concrete reinforcing bars, bridges, culverts and other purposes. These figures, it has been shown, apply pretty generally to all other road-building states.

Based upon them, the statistical department of the American Farm Bureau Federation has shown that on the road program of only 10 states of average size in 1921 the "Pittsburgh Plus" excess cost item was alone $1,912,850—practically $2,000,000.

That sum could well be multiplied by five, for the total number of states in the country, to show what toll "Pittsburgh Plus" takes upon the taxpayers in the construction of hard roads. That would make $10,000,000. Thus it is plain how "Pittsburgh Plus" mulcts the farmers and all other taxpayers.

HALLADAY HAS ONLY ONE RIVAL FOR HONORARY TITLE

HERMAN H. HALLADAY, secretary of the Michigan Agricultural College, and of the State Board of Agriculture, has a wide circle of friends but we doubt if many of them know that he has the right to sign "D. V. M. (Hon.)" after his name. Mr. Halladay is the holder of the only honorary degree of "Doctory of Veterinary Medicine" ever granted by a Michigan institution, and Dr. Ward Giltner, Dean of the M. A. C. Veterinary School, has discovered only one other person in the United States on whom a similar degree has been conferred by any college. The other honorary D. V. M. is the Dean of the Veterinary School at Cornell Universary. Mr. Halladay's honor was bestowed upon him in recognition of his services in the eradication of the foot-and-mouth disease in Michigan.

GRATIOT PLANNING BIG FAIR

THE Gratiot county fair will be held at Ithaca, August 25 to 29, and plans are to make it the best ever this year. Secretary McCall says "We expect to have a big fair this year and a fine stock show. There will be races every day and for free entertainment each day we have secured 16 big acts. Saturday, August 30, the K. K. K. will have a big celebration and public marriage on the grounds. Tell everyone we will be glad to have them come."

TO PICTURE JAPAN DISASTER IN SKY AT STATE FAIR

TWO of the greatest fireworks spectacles ever produced are promised for the State Fair in Detroit, August 29 to September 7. They are "Tokyo—Through Quake and Fire" and "The Founding of Detroit."

These productions are so big, and necessarily so costly, the program must be divided between them. The first three nights of the fair, Friday, Saturday and Sunday, "The Founding of Detroit" will be shown and the remaining nights "Tokyo" will have the sky.

The "Founding of Detroit," made specially for the Seventy-Fifth State Fair, will tell the story in fireworks of the old Fort Ponchartrain days, the battles between the French and English and Indians for the vantage point were now stands one of the greatest cities of the world.

"Tokyo" will show in lines of fire against a black sky the scenes of horror that gripped Japan in 1923, the falling buildings, the lighting and the fire.

POTATO GROWERS TO MEET AUGUST 20-21

THE sixth annual meeting of the Michigan Potato Growers' Exchange will be held in Cadillac, August 20 and 21, according to Fred Smith, Vice-President and Acting Manager.

Over 6,000 Farmers Spend Day At M. A. C.

"Old Timers" Hay Cutting Contest is Popular Feature of Seventh Annual Farmers' Day

FARMERS' DAY at the Michigan Agricultural College has been popular with the farmers ever since the first one held in 1918 and each year the attendance has shown a gain. This year conservative estimates placed the crowd around 6,000 and others putting the figure at from 7,500 to 10,000, but even at the lower figure all previous attendance records were shattered. Automobiles began to arrive as the sun appeared in the east and the number increased hourly until noon but long before that hour it was necessary to call the state police to direct the traffic.

The morning was given over to observation tours, the college having arranged 8 different tours for those interested in the different phases of work being carried on. The feature of the morning program was the "Old Timers" mowing contest which started at 10 o'clock and lasted for two hours. Here 27 old-time farmers from 55 to 90 years old took part in a scythe contest and they proved to the onlookers that they could handle the scythe just as good as they could in the days when mowing machines were unknown. Each old timer was given a stretch of alfalfa and allowed five minutes to do his "durndest." H. H. Halladay, secretary of the college, cut the first swath, giving the other "boys" a mark to shoot at.

Four silver trophies were awarded to the "hay cutters" as well as several honorable mention ribbons. The judges were I. H. Butterfield, father of Kenyon L. Butterfield, president-elect of the M. A. C., Jason Woodman, former member of the State Board of Agriculture, Wm. F. Johnston, agricultural agent of Wexford county, and H. F. Probert, of Jackson. The first silver trophy was awarded for the best all around work and won by P. F. Waldron, 68 years old, of Ionia. I. P. Mosley, 90 years old, of Onondage, won a silver cup as the oldest contestant. E. Judson, 58 years old, of Durand, cut the neatest swath and was awarded a silver cup. The fourth silver trophy went to E. S. Goodhue, 60 years old, of Bath, who did the most work of acceptable quality, cutting 737 square feet of alfalfa in his five minute period. Those who received honorable mention were: D. P. Ashley, of Dimondale; Wm. E. Root, of Swan Creek; William Lear, of Saginaw; Frank Johnson, of Potterville; N. Snyder, of East Lansing, and A. F. Huntoon, of St. Louis.

Time to Eat

By the time the last contestant in the mowing contest had cut his swath the crowd was ready for something to eat. Most families brought a basket full of lunch and it did not take them long to find a nice shady spot on the campus where they could eat and rest. After they had eaten and rested a few minutes the crowd began working over to where the afternoon meeting was to be held and, after looking over the special exhibits on timely farm subjects prepared by the different departments of the College and placed on display in booths on the campus, they sat down on the seats that were placed in front of the speakers' stand. Long before 1:30 when the Reo Motor Car Company band and glee club opened the afternoon program all seats were filled and thousands were forced to stand as the attendance had passed all expectations. Second on the program was the parade of College livestock, and then we were entertained again by the band and glee club. Acting President R. S. Shaw, who presided, then introduced the first speaker of the afternoon, A. M. Brown, of Schoolcraft, former secretary of the M. A. C., who talked on the progress in agriculture. He was followed by Prof. J. T. Horner, of the College, whose subject was "Effective Marketing." We were again entertained by the band and glee club after which Acting President Shaw introduced G. I. Christie, director of the experiment station and extension work at Purdue University, and his talk was on "Agricultural thought." Another number by the band concluded the program.

Sees Marketing Main Problem

In his talk on "Effective Marketing" Prof. Horner spoke in part as follows:

"Science has made it relatively easy to produce goods. Whether it be in agriculture or industry the great problem is that of selling. Everyone would be happy if all the things he produced could be sold at a profit. The merchant, the manufacturer, the farmer—all of these—want to know how to sell. The farmer wants someone to tell him how to sell all the things he can grow at cost of production plus a profit.

"The first essential to profitable selling is a knowledge of what the consumer wants. Studies must be made of the markets to determine what the consumer wants, how he wants it, when he wants it, and how much of it he wants. The successful manufacturer has been making this study ever since the time arrived when he could not readily sell all the things he could produce. With an increase in the facility of producing goods there has been an increase in competition and men have had to struggle to get the consumer to buy their goods instead of those of competitors. Unless proper selling methods are followed one is apt to find that his competitors get all the business.

"But efficient production alone will not bring prosperity. Efficient marketing must go hand in hand with efficient production. The prosperity of a farmer depends upon all phases of his business being conducted in the best possible manner. These two things—production and marketing—go hand in hand. Success can not possibly come unless due consideration is given to both. Prosperity is never going to come to agriculture unless production is efficiently conducted and is in harmony with market demands. No production program can be profitable unless it is conducted with regard to the market. Likewise, no market program can be effective if productive efficiency is disregarded.

"Many farmers have recently discredited the counsel of production specialists. They have said, 'We know how to produce. Tell us how to sell. The two blades of grass theory has been wrong. We want to know how to sell one blade.' I trust the time will never come when farmers earnestly desire to discard the science of agriculture. Scientific production is essential to prosperous agriculture and a wealthy nation. The scientific specialists can show farmers how to reduce costs and how to secure quality.

Better Thinkers

"We need to become better thinkers. When the American farmer gets to thinking more clearly on social and economic problems there is going to be improvement in these fields just as there was in the field of mechanics, plant and livestock improvement, and other sciences when the torches of thought and reason lighted the way.

"The American farmer has at times been led into the wilderness of fanatacism and unsound economic thinking by those who have been ignorant or basicly dishonest. He has been wrong at times not because he desired to be wrong but rather because of his faulty guidance. In spite of the fact that he has occasionally gone wrong never from under the roof of the farm home has there come a movement or aid to a movement which has been for the moral degradation of this nation."

Farmers Appreciating Work

Mr. Christie spoke on the assistance which agricultural institutions give to the farmers of the state, in an effort to better conditions of the agriculturists.

"Farmers are appreciating more and more," said Mr. Christie, "the value of agricultural colleges. They are receiving most valuable help from the experiment stations and the extension service, and as a result are able to meet in a better way the big farm problems.

"These institutions which have developed new and valuable varieties of grains, helpful information on soils and farm practices, unusual aid on combating disease of livestock and insects of the orchard and other direct assistance are growing stronger each year and are meaning more and more to agriculture and country life. For every dollar spent by the agricultural colleges, the farmers of the state have received many thousands in return. A conservative estimate shows that the Michigan Agricultural college is returning to the farmers of the state more than $25,000,000 annually. This institution then, should have the active support of all the people of the state."

Speaking of the increase in grain prices, Mr. Christie said:

"The agricultural situation has changed by the recent rise in prices for farm products. Farmers are showing a changed attitude, while business in general has shown renewed activity. It is encouraging to see this turn in events and I believe that it means a brighter future for our agriculture.

"During the past three years, farmers have had opportunity to make and have made a study of their situation. They recognize that a program must be made for the individual farm. The market, the farm and the man must be considered. They also recognize that millions of people in our cities must be fed from the farms and that these people must eventually pay a fair price for the producing of these products.

"Farmers located in Michigan and in parts of the central west are in a fortunate position since the large manufacturing centers and a large share of the population of the country is within a short distance of these producing areas. The Michigan and Indiana farmers have advantages which are now showing and which will make these farms more profitable and valuable."

Can Any Farmer Beat This?

SWEET clover 8 feet 7 inches high! Rye 6 feet 4 inches high!

W. F. Causie, manager of the Johnson farm at Jackson, Michigan, gives up these figures for sweet clover and rye he grew and has on exhibit at the Jackson News office, Jackson. Other crops on display and their heights are as follows: Alsike clover, 6 feet 4 inches; June clover 4 feet 10 inches; timothy hay 5 feet 8½ inches; wheat 4 feet 11½ inches; barley 4 feet 5 inches, and oats 5 feet 4 inches.

"Can anybody beat it?" he writes THE BUSINESS FARMER. What about it, friends? Can any of you beat this record?

Mr. Causie writes "We do not claim any credit for the growth of the display. It only goes to show what will grow if the land is good. Nothing was used but barnyard manure. The wheat was top dresses early. The barley and oat ground was fall plowed and double disked in the spring."

We would like to hear from some of our readers about their crops. If you can beat this record we want to know about it. Let's go.

WHO WILL BE THE HERO?

Living the Full Life in the Rural Community

The Farm Offers Best Conditions Not Only For Personal Development but Also for the Founding of an Ideal Home

By STANLEY M. POWELL

(Lansing Correspondent of The Business Farmer.)

OUR readers will no doubt be surprised to read such an article by Stanley M. Powell after following his series on taxation so perhaps an explanation is due. Stanley is a very busy man and recently, finding himself just about worn out, he decided to take a brief vacation. At Ionia Stanley and his father, H. E. Powell, operate an up-to-date farm known as "Ingleside Farm". The "Son" of "H. E. Powell and Son" has duties that keep him in the city most of the time and his idea of a vacation was to retire to the farm to help his father and rest. He went to the farm and while there his thoughts, quite naturally, turned away from facts and theories of taxation to something more in harmony with his surroundings. And after a few days came the desire to put these thoughts down in black and white. By Sunday afternoon he could control his desire no longer so he carried his typewriter out on the front veranda and—well this is the result. It contains some very good thoughts and we hope you like it. Write and tell us what you think, whether you agree with the writer or not.

THE peace of an ideal mid-summer Sabbath afternoon has settled over the old homestead. It is one of those perfect days which must have inspired the poet when he sang, "How good is man's life, the mere living! how fit to employ all the heart and the soul and the senses forever in joy!"

How blessed and how welcome is the peaceful naturalness of this afternoon hour. I am mentally comparing it with the tumult and confusion of certain congested cities and so-called resorts and recreational regions which I have recently visited. Verily how hard do certain people struggle chasing the illusive rainbow of happiness! Frantic diversion, high powered automobiles, long, gruelling motor trips being only partial satisfaction.

Real joy, peace, contentment, comes not from without, but from within. Yet Nature is a potent factor in effecting this inner consciousness. And so how pleasant is the porch this afternoon! The breeze blows intermittently, now and then bringing the windmill into life—only to let it relax into idleness once more. How still it is! And yet when we listen closely we hear all the myriad voices of Nature singing their separate songs, yet blending them in a harmonious and subdued chorus.

Who can blame me for rejoicing that I am the "and Son" of one of those father and son partnerships which is carrying on an old homestead cleared from primeval forests by my father's father? Who can blame me if this afternoon I feel a little selfish regret that some of my duties and connections cause me to be away from the farm home so much?

This afternoon is a gift from God, intended for happiness and meditation. As I look across the verdant lawn and undulating acres stretching away to the horizon, my eyes half close in thought and my soul is lost in reverie and contemplation. Tall elms cast shadows near at hand upon the lawn. Shade and shadow, vaguely mysterious, symbols of life's checkered path! Yet far away across the fields and on the hills the sun is shining brightly—Peace reigns o'er all. Thus do I meditate:—

And What Is Peace?

Men say that the war is over, that the armistice is signed, and that lasting world peace has been established. Perhaps, politically speaking, this is true, but taken in its larger, more abiding aspects, peace does not yet rule among the affairs of men. Consider the world today—it is one vast battlefield. It is not a battle of bombs and bullets, of subs and aeroplanes. It is the same old battle of life, the same old struggle for existance—only animated and aggravated, crazed and driven frantic by the restless spirit of the twentieth century.

Here and there, it is true, we can find isolated and secluded havens where the spirit of economic and social conflict has not penetrated with its blighting influences, but these communities are scarce and far between. Even those districts, where life seems the most free and unhampered by the pressure of the outside world, are often the very communities which are supported by the fiercest economic oppression of the laboring classes.

If anyone feels that I have overdrawn the picture, let him only look around him and see. Let him remove from his eyes the scales of custom, of indifference, and of thoughtlessness. Let him really try to discover and analyse those thoughts and emotions which all unknown and unbidden are stamped on every man's face, reflected in his every act. Let him walk down the busy streets with their hurrying, jostling crowds. Let him ride on the crowded trolley, and let him visit the factory and workshop. Everywhere let him study people, their faces and what they reveal.

Nor would I have you think that I am confining these observations merely to the lower classes. It seems that the struggle is even more intense among the so-called intellectual workers. The more a man has, the more he wants, and the more society demands of him. Thus the fairly successful business or professional man often grows old prematurely and misses the real joys of life.

The Advantages of Farm Life

I have wandered thus far afield from the title of this article, not by way of digression or useless comment, but that I might restate some of the fundamental principles of human experience and conduct and thus bring to your attention by comparison and contrast some of the reasons why I wish to advocate the farm as the ideal environment in which to live the full and complete life. I would not have anyone think that I believe that conditions of life on the farm are entirely unlike and superior to those found in the more congested city districts. In many respects the difference is only one of degree, but there are several elements of farm life which are not found in the city. Let us, therefore, consider some of the factors which contribute toward making life what it is on the modern farm.

In the first place, the occupation of the farmer is both useful and honorable. Probably never before has society so valued and appreciated the basic importance of agriculture and esteemed the farmer so highly as at present. The war opened the eyes of the general public to the importance of the farmers as the producers of the basic necessities of life. The new tendency of farmers to organize and act collectively has given them a voice which is accorded respectful attention both in the halls of legislation and before the forum of popular public opinion. A man who takes up farming may, therefore, command the full respect both of himself and of his fellowmen.

One of the features of farming which has appealed to men of all times is the degree of independence which it affords. The farmer is the entrepreneur—the manager of his enterprises. While his life may not at all times be easy, there is always the satisfaction of knowing that he is his own master, that he can choose what is to be done, and that he will receive the rewards of his foresight and industry. This is a factor which appeals strongly to every man.

The great drudgery and intense physical exertion which was the bane of farm life in past generations is rapidly disappearing due to the extensive use of improved machinery in nearly all of the farming operations. Happily these improved implements have not removed the farmer from his former close contact with nature. His is still the out-of-doors life. He still lives close to nature—sees all her mysterious secrets—from the glorious beauty of the sunrise until the many-colored sunset marks the end of another day's labor—from the wondrous wakening of all life in the Springtime to the quiet, mellow days of Autumn when he gathers in the last fruits of the season. No other class of men live in such close natural contact with the Creator, and no other has such an opportunity to see His character revealed in the world about and "think His thoughts after Him."

The Farm the Ideal Home

It is a fact well worth considering that the farm offers the best conditions not only for personal development but also for the founding of an ideal home. This is a factor not to be considered lightly when we notice that the home life of the city is rapidly degenerating and losing its potent and sacred influence. It does not seem possible to produce real men and women of high Christian character and American ideals in the haunts of the cliff dwellers of our cities, in appartments or crowded tenements. It is not a matter of mere chance that so many of our country's greatest leaders have been produced in farm homes. Those forces which operate to disintegrate and destroy the unity of the city home do not exist to nearly as great an extent in the rural community.

On the other hand, the primeval isolation, which formerly turned the agriculturalist into an object of ridicule, is no more. The rapid settlement of our country, the development of the telephone, automobile, rural free delivery and radio, have forever broken down this barrier. The farmer may now live as an intelligent member of human society, knowing what other men are doing and appreciating their conditions. Good roads and the automobile bring him in close contact with the city so that he can share all its social, religious, and educational advantages, and still enjoy all the benefits of living on the farm. Or, without leaving his chair he can bridle the unseen waves of the air and make them contribute their toll of entertainment and instruction.

The farm home need no longer lack those conveniences and amenities which add so much to the comfort and joy of living. A great many farm lighting systems have been perfected. Many farm homes are also now equipped with water systems which provide running water, bath and toilet facilities. The general use of such household impovements is bound to increase rapidly in the years just ahead.

The Farm Horizon Lifts

The farmer's life is not a life of selfish social and business isolation. No longer does he think in terms of "me and my wife, my son John and his wife, us four and no more." More and more the spirit of cooperation and fellowship is spreading among the farmers. The great extension movements, such as the county agent work, the boys' and girls' club work, the home demonstration activities, school and public health nurses, the county Y. M. C. A., etc., all show the increased attention which is being devoted to this sort of thing.

During these past few years this cooperative spirit has given birth to the great farm bureau movement and today over the length and breadth of the U. S. A., there are local, county, state and national farm bureau organizations which are fostering and promoting cooperative marketing on a commodity

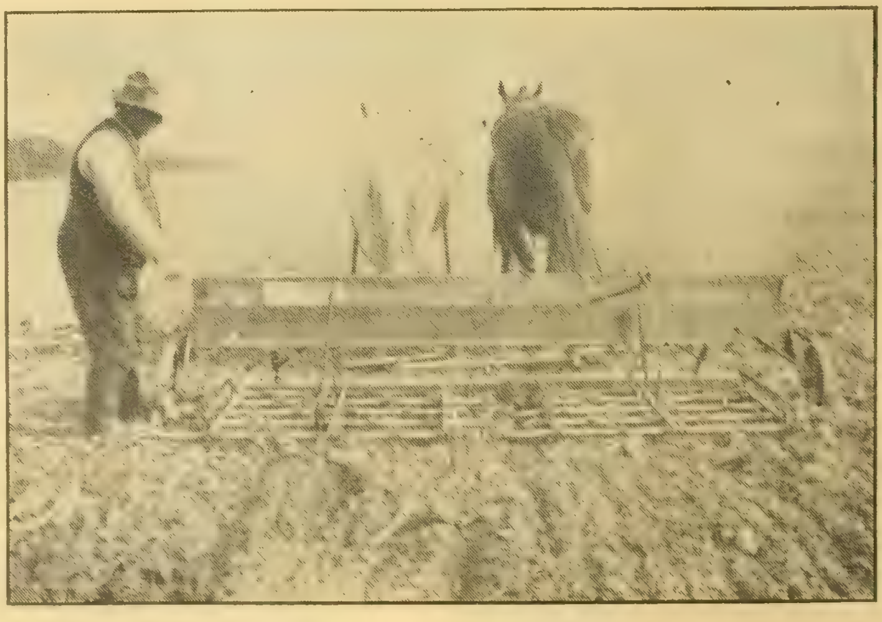
(Continued on Page 21)

Putting Alfalfa Seed in Ground at Right Depth

ONE problem in sowing alfalfa seed is, to get it in the moist ground just the right depth and before the innoculation had been killed by the Suns rays. Some use one method and some another, many of which are good.

Mr. E. H. Black, of Cass County Michigan, has a rig that does the job in fine shape. As shown by the accompanying cut, it consists of a force feed seeder bolted to the evener bar of a 60 tooth spike harrow. In the cut the outfit is shown being used on a corn stubble that has been disked for alfalfa. It works well in spite of the stubble. By actually digging up seed they were found to be covered to a depth of about one inch.

The seeder saves seed as with any definite feed drill smaller quantities may be sown. It sows the seed in fresh earth back of the first row of drag teeth. It covers the seed before the innoculation is killed by the Suns rays. It will work on wheat and rye ground in the spring, or on ground that is too rough for seeding with a drill. It saves once over the ground as compared to the fiddle type of seeders. It puts the seed home to moist warm earth with a shallow covering above it and this is what is desired to get good results.



Seeder working under hard conditions

PICTURES FROM FAR AND NEAR

HAY CUTTING CONTEST.—The "Old Timers" mowing contest held on Farmers' Day at the Michigan Agricultural College was the leading event of the forenoon. Here we have a few of the contestants about ready to start.

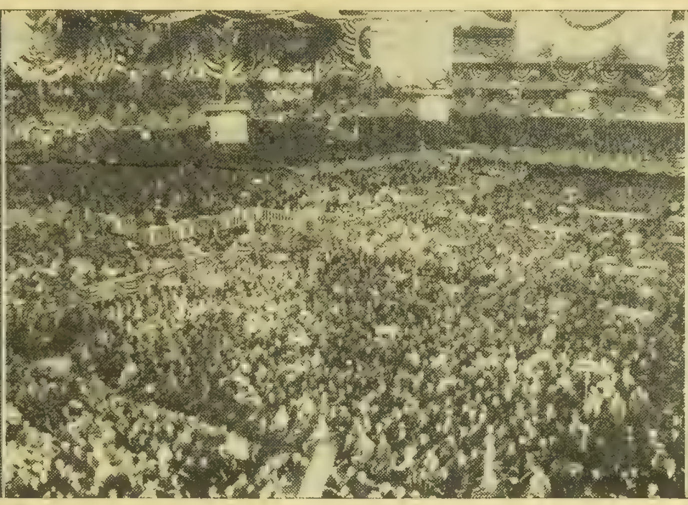
JUDGES IN SCYTHE CONTEST.—These men picked the winners in the contest at the M. A. C. Left to right: Wm. F. Johnston, Wexford county agent; Jason Woodman, and I. H. Butterfield, father of Kenyon L. Butterfield.

PRIZE WINNERS.—Michigan's champion hay cutters. Left to right: P. F. Waldron, Ionia, best all around work; E. Judson, Durand, neatest swath; E. S. Goodhue, Bath, most work; I. P. Mosley, Onandago, oldest contestant.

FARMERS' DAY.—This picture was taken while Acting President R. S. Shaw was making a few introductory remarks before introducing the speakers. This does not show the entire crowd but it will give you some idea of how interested they all were.

SHOW COLLEGE LIVESTOCK.—One of the features of the afternoon program of Farmers' Day was the parade of blue ribbon livestock owned by the Michigan Agricultural College. Horses, cattle, swine, sheep and poultry, all had a part in the parade.

APPROVES OF TAX EXEMPT SECURITIES.—Senator Couzens is being criticised by many for his stand in favor of tax-exempt government securities. It is stated his fortune is invested in these securities.



WITH THE DEMOCRATS AT MADISON SQUARE GARDEN.—This is a general view, showing the interior of Madison Square Garden, New York City, where the Democratic national convention was held. The photograph was taken as the meeting was called to order on the opening day.

A REAL BEAUTY.—Miss Jean Shields, telephone operator of Cincinnati, Ohio, has won 5 beauty contests since last year. They were in Kansas City, Salina and Linnsburg, Kansas, and Cincinnati.

URGES CHLOROFORM FOR SUBNORMAL CHILDREN.—Supt. K. C. McLeod, of Edmonton Canada declares all mentally subnormal children should be chloroformed to death.

WHICH WAY ARE YOU GOING TO VOTE?—Betty Brown on the donkey and Agnes Lee with the elephant on the sands of Atlantic City show their political leanings for the coming campaigns.

STATUE OF "ADAM" GOES TO CHICAGO UNIVERSITY.—This original Rodin statue of Adam has been presented to the Art Institute Museum of Chicago.

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

SCHOOL BOARD MUST PAY TUITION

We have three boys of high school age. We made application to the school board of our district, before the fourth Monday in June, but since then have decided to move out of the district, and the boys will not be able to attend the school which the application was made for, but will still be in the same county but in another township. Would the school board of this district still be obliged to pay the tuition? Or will we have to pay it ourselves if we move from the district before school starts in September?—W. O., Muskegon, Mich.

PARAGRAPH (521), page 221, Revision of 1923 General School Laws of Michigan, reads in part as follows:

"The district board or board of education of any school district which does not maintain a high school shall have authority and is hereby required to vote a tax sufficient to pay the tuition to any high school which is approved by the Superintendent of Public Instruction******Provided, that the parent or the legal guardian of such child******shall give written notice to the district board or board of education on or before the fourth Monday of June, that such child desires to attend any high school during the ensuing year."

The law does not require a particular high school to be mentioned in the application for tuition. If the proper application is made the school board must pay the tuition to any approved tuition high school in the state. If proper application is not made the board may pay it. The fact that the family in question moved from the district to another district not maintaining a high school does not relieve the first district of its responsibility.—C. L. Goodrich, Ass't. Supt. Public Instruction.

WALL SHOULD GO BELOW FROST LINE

Would you please answer through your columns some questions in regard to house building? I want to build a bungalow, the wall of faced stone up to the eves which would be about 10 feet. How deep should the wall go in the ground? Will have no basement, as the soil is clay not very well drained. How thick should the wall be above ground, and how thick should the foundation wall be below the surface? I think your service department is grand. It does me good the way you expose those fur and land sharks.—L. R., Twining, Mich.

THE foundation wall should go below the frost line in case there is no basement. The foundation wall should be at least 14 inches thick and have a footing 24 inches wide and 6 inches deep. I would suggest that the whole foundation be made of concrete.

The wall above ground should be about 8 inches thick. I understand that you are facing the stone onto the frame work or in other words, that it is what we commonly term stone veneer building.—F. E. Fogle, Assistant Professor, Agricultural Engineering Dep't., M. A. C.

HOW MUCH EXEMPTION?

Please tell me just how much one is allowed by law before he is collectable if his 40 acres is mortgaged and cows not all paid for besides other notes?—A. D. E., Tustin, Mich.

YOU would have a homestead exemption in your 40 acres of land if it is the only real estate you have and you live on it. You would be exempt in personal property to the amount of $250.00.—Asst. Legal Editor.

WANTS PRIMARY MONEY TRANSFERRED

We have property in District No. 1 also in District No. 3 where we live. Now it is nearer for children to go to No. 1 school also roads are better and conditions in general are better. My mother went to No. 1 and I went to No. 1 and now my son went to No. 1 one year. They do not want to have our children unless we have our property all transferred to No. 1 so they can get all the school tax. The board voted on it and would not let us leave No. 3. Unless we pay $1.50 a month tuition we cannot send children there. We have five and it would mean a lot of money in one year. Have heard one can have head tax transferred. Is this true? How can one go about it and to whom apply? Would the head tax apply on tuition? Have we the right to send children to District No. 1 as we have property there too. It is over two miles of mud roads to No. 3 while to No. 1 it is 1½ miles in all, part gravel and remainder will be concrete. The amount of land is about the same in both districts altho buildings are in No. 3.—Mrs. L. K. O., Palms, Mich.

A DISTRICT in which a parent does not reside is not compelled to accept children of other districts. The primary money cannot be transferred from the district where the parent or legal guardian resides to a school where he wishes his children to attend school.—W. L. Coffey, Deputy Superintendent of Public Instruction.

LEVY EXECUTION AGAINST PROPERTY

A signs B's note. Now both A and B refused payments for over two years. After that note holder put judgement against A and B for collection. Then A and B promised to pay so much monthly and then both A and B failed. What is the law to collect these notes? Kindly advise me what to do. Your subscriber for many years, S. G., Knox, Ind.

IF you have obtained a judgement against A and B on these notes, you could levy an execution against their property, or garnishee their bank account or wages. Go to the judge who gave you the judgment and tell him you want to get out an execution against their property.—Asst. Legal Editor.

CAN HE KILL ANIMALS DESTROYING CROPS?

Can a farmer kill any bird or animal if they are destroying his crops or animals (turkeys, chickens)? Is it against the law to shoot a gun on your own property without a hunting license?—H. J., Algonac, Mich.

IT is impossible to give a specific answer to the above inquiries. Property owners would not be justified in killing animals or fowls trespassing on or destroying their property except possibly in case an animal was vicious and endangering lives of people on premises or destroying sheep or cattle thereon. Of course, the property owner would have an action for damages against the owner of animals or fowls trespassing on his premises and damaging them. We also have a statute which permits the owner of premises to distrain and sell cattle trespassing thereon. In reply to your second question will advise you that it is not necessary for a person to have a hunting license to shoot a gun on his own property unless he is hunting thereon.—Clare Retan, Deputy Attorney General.

CAN GET DIVORCE

If a man's wife is proved mentally unbalanced would that hinder him from getting a divorce from her? Could he get possession of the children. What would be the proper step as to me finding out her sanity? Would like to hear from you as soon as possible. Just received word that my wife has applied for a widow's pension.—A Lively Dead Man, Newberry, Michigan.

THE fact that your wife is mentally unbalanced would not alone prevent you from obtaining a divorce. In order to determine her sanity, file a petition with the probate court to have her adjudged insane. The question will be determined in a hearing before the probate judge.—Asst. Legal Editor.

CAN OFFICER COLLECT MONEY FROM MOTORIST?

I have been taking your valuable paper and would like information through the service department on the following subject: Has a motorcycle cop the right to collect money on the public highway for what he calls speeding?—R. J. P., Caro, Michigan.

A MOTORCYCLE officer has no right to collect money from motorists for speeding. He has the right, however, to arrest them and take them into custody. He usually gives them the privilege of depositing money with him to insure their appearance at the trial, instead of taking them into custody. The motorist should insist on a receipt to protect himself.—Asst. Legal Editor.

STOPS SALE OF GRAVEL

Three years ago I bought a small farm on a contract from Mrs. D. and was to pay $50 per year with interest at 7 per cent. Last winter I opened a gravel pit and Mrs. D. served a written notice to stop selling gravel or pay her up in full for the place. Now must I do this? The contract reads that all buildings must be kept in as good a repair as when I took possession but does not say anything about taking gravel or timber from this place. Also Mrs. D. tried to collect proceeds from gravel. Did she have a right to do this? Must I pay her in full or have I a right to sell gravel and use the proceeds to improve the place?—L. A. R., Lowell, Mich.

IF the removal of the gravel would so depreciate the value of the land as to endanger the seller's security, she would have the right to restrain you from selling the gravel. It all depends upon the amount of gravel removed and its relation to the value of the farm without the gravel. I would see a lawyer.—Asst. Legal Editor.

MUST PRINT TRUTH IN ADVERTISEMENTS

I have a beauty secret for the hair and I would like to advertise and charge for it; it is absolutely true what I would advertise. I have no medicine to sell, nor would there be any used. Would it be legal for me to advertise? Also I would like to sign a Nome de Plume. Is that all right?—Reader, Arenac County.

UNDER the provisions of Section 15049 as amended by Act No. 351 of the Public Acts of 1917, a person is criminally liable for any false statements contained in advertisements published in a newspaper or otherwise.

If the statements which you wish to publish are true and are not misleading, you would probably not be violating any statute of this state. It you advertise under any name other than your own in connection with your advertisement you might technically be violating the statute above mentioned.—Clare Retan, Deputy Attorney General.

TEACHER NOT ENTITLED TO PAY DURING VACATION

If the School board signs up with a teacher for a week's vacation between Christmas and New Year's do they have to pay teacher for same? How many vacations with pay is a teacher entitled to each year?—J. M. W., Gladwin, Mich.

IF a school board signs a contract with a teacher, which provides for a week's vacation between Christmas and New Year's, the district does not pay for such vacation period. A teacher is not entitled legally to any pay for any vacation period, that is, any period within her contract which is specified as a vacation.

The law provides that no school shall be maintained in any public school nor shall any deduction be made in a teacher's wages for the observance of the following days: Labor Day, which is the first Monday in September, Thanksgiving Day, as set apart by the Governor, Christmas Day, New Year's Day, Memorial Day, and the fourth day of July. Whenever any of the above days come within the period of contract the teacher is entitled to pay for same. When any come within the period of vacation as specified in teacher's contract the teacher does not draw pay for same. Such days are designated as legal holidays for schools.—G. N. Otwell, Supt. Division of Rural Education.

WIFE WOULD GET ONE THIRD

Please give me the correct law answer to the following: When I married my husband a year ago he had property which he was selling under contract and it will be some few years before it is paid out. Now if he dies in the meantime, will I get one-half of the amount left or would I share equal with his three children by previous marriage? That is if there is no will or deed or any provision made for same.—Mrs. A. S., Jasper, Mich.

ONE third of the amount due the husband on the contract would descend to the wife and the other two thirds would go to the children by former wife.—Asst. Legal Editor.

Uncle Rube Spinach Says:

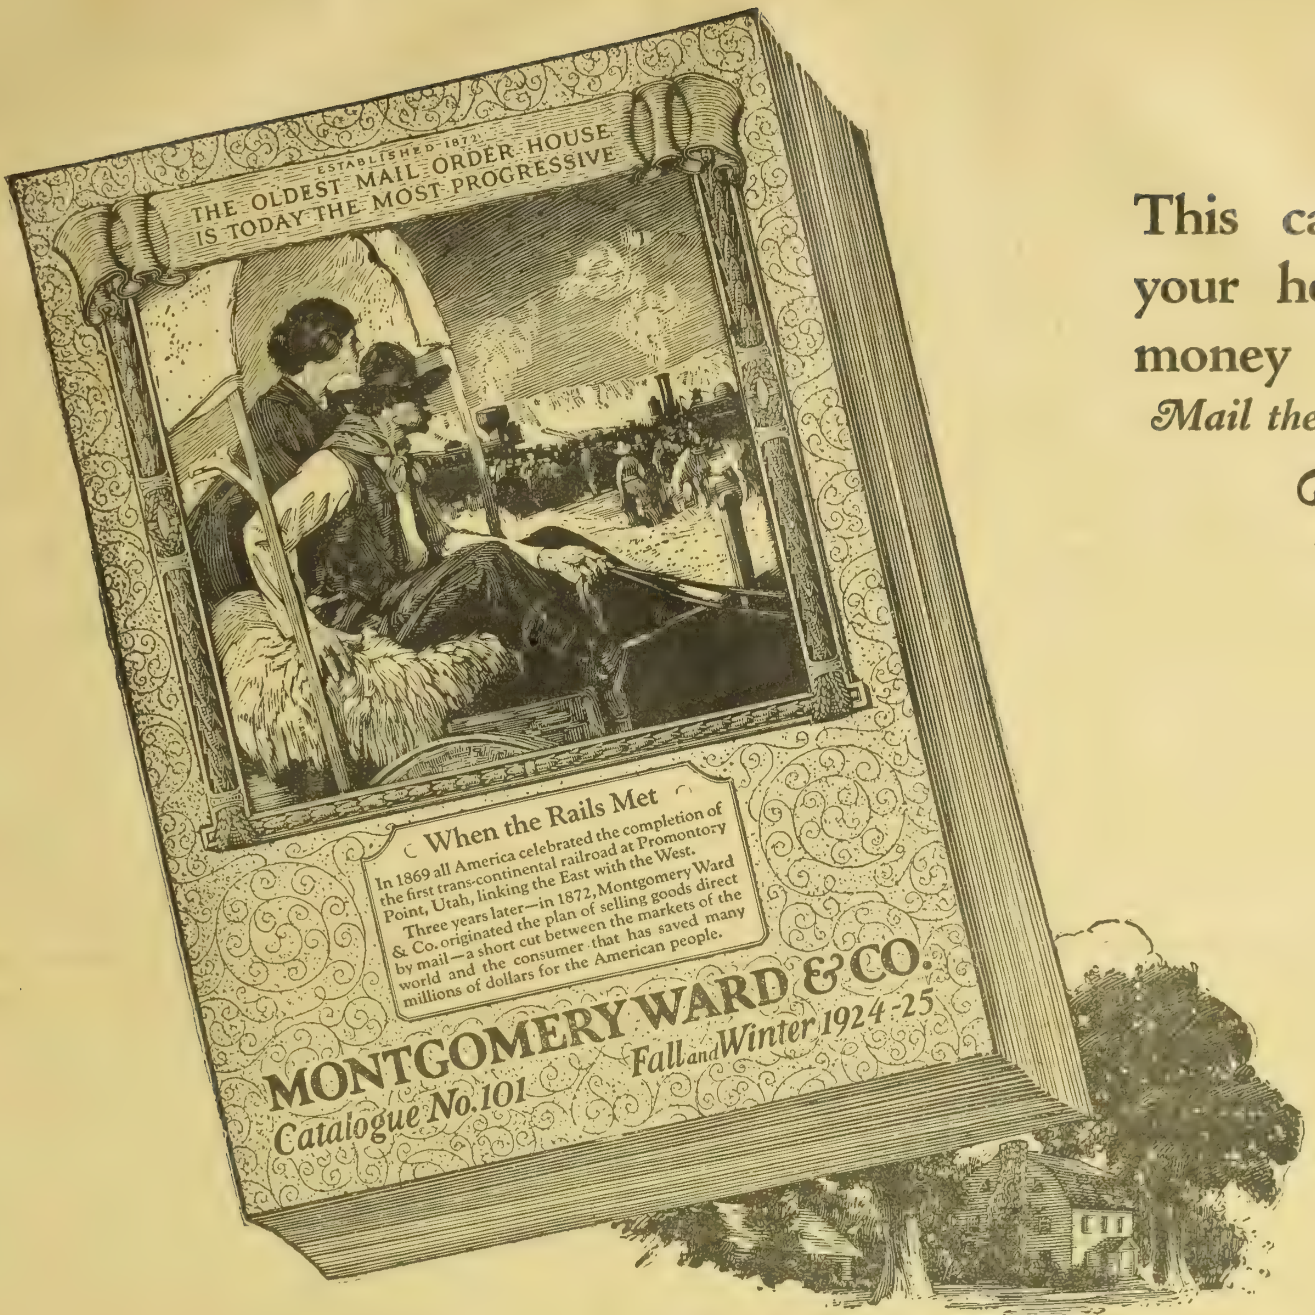
YES THEY'RE LEAVIN' THE FARM

BOYS are leavin' the farm—they're goin' to the city an' gettin' jobs an' gettin' mixed up with lots o' thing that ain't so very good for 'em. An' that they'd be better off without. I have a lot of farmer boys workin' with me—I like them an' I like to be with them. I like to have 'em tell me their troubles an' why they left the farm. It's most always the same story—no chance out there—just hard work an' no money. "Oh yes," one young man said, "Dad did all he could for me—he works hard but farming don't pay much an' he couldn't do much for me and so I quit."

Now of course the boy didn't stop to think of the 19 years that Dad had been keepin' him, feedin' an' clothin' him, lovin' him an' sendin' him to school an' tryin' to make somethin' of him. No he never thought of that! It hadn't occurred to him that he owed Dad anything.

He was just old enough to pay his way an' help Dad a little, but he couldn't do it—he had to have money whether Dad did or not—no matter 'bout Dad, he was gettin' old any way an' didn't need much, he would git along some way. Well the young man gets good wages here an' he lives high. He isn't saving any money, jest spends it as fast as he gits it. He goes out with flashy girls an' they make him think he's some great guy—he feeds 'em on high priced stuff, takes 'em to shows, rides in taxies, blows his money an' is always broke before pay day.

Yes the city is a great place for farm boys—it builds 'em up or down—mostly down. Boys I am tellin' you right now to stick to the farm, help Dad out an' build a good healthy body for yourself. There are many years before you—years that'll be full of pleasure an' happiness for years if you raise yourself right. But my dear young friends, you can spoil it all in just a short time in any city. City life is too fast an' you don't have much at the end of the year but regret, just a feeling that you have made a mistake,—a dark brown taste so to speak,—an' you'll wish you were back on the farm where all is clean an' nice, where your folks are an' country girls are, an' in all this whole big world there is nothing quite as sweet an' nice as our farm-raised girls. Just as sweet an pure as the apple blossoms—mebbe they ain't the best dancers, mebbe they don't use paint an' lip sticks like our city girls but they are healthy an' good to look at—they make good wives an' mothers an' they know how to cook an' bake an' take care of a home. So, knowin' what I know, I'm sayin' to my boy friends all over this big state of ours, jest stick by Dad, help him out now an' pay back part of what he's done for you. You can not ever pay it all; boys if you could only know all he an' mother has done for you you would realize that a lifetime of service would only pay jest 'bout half the debt. Cordially yours,—UNCLE RUBE.



When the Rails Met

In 1869 all America celebrated the completion of the first trans-continental railroad at Promontory Point, Utah, linking the East with the West.

Three years later—in 1872, Montgomery Ward & Co. originated the plan of selling goods direct by mail—a short cut between the markets of the world and the consumer that has saved many millions of dollars for the American people.

This catalogue in your home means money saved

The New Ward Catalogue Is Ready

One Copy Is Yours—Free

One copy of this new 728-page Fall and Winter catalogue is ready for *you*. It costs you absolutely nothing. Asking for it puts you under no obligation.

You need only fill in and return the coupon. We will send the catalogue free.

We want you to find out how valuable this book will be to you. We want you to learn how much it will save you and your family.

Our Force of Merchandise Experts and $50,000,000 Cash Produced Thousands of Bargains

Every buyer of ours is a merchandise expert. He knows quality and how to get it. He knows value and where to get it.

He is free to go anywhere—in America or in Europe — anywhere to get the best goods for our customers at the lowest prices. Millions in cash are available. And his first consideration is — get the quality our customers want and get it at prices that give our customers most for their money.

500,000 New Customers Won By Our Big Values Last Year

500,000 more people bought from Ward's last year than ever before. In three years our customers have doubled their total purchases from Ward's! Why? Because Ward's prices brought them a saving. Because they got more in actual value. We never sacrifice quality to make a low price. We offer no price baits. We sell only the kind of goods that stand inspection *and use*.

Your Order Shipped Within 24 Hours

With a saving, with your satisfaction guaranteed, with the quality of everything you buy backed by a fifty-two year old reputation for selling honest goods—with these advantages you are also assured prompt service. Most of our orders are shipped within 24 hours, nearly all in 48 hours.

So use the coupon. Get the new catalogue. Investigate. Find out if it pays you to continue buying from habit alone. Compare prices on everything for the Farm, the Home and the Family. See for yourself the saving that may as well be yours.

What the Neighbors Say

USE ECONOMY

DEAR EDITOR:—I am sending $1.00 for two years subscription to your paper. I read in your paper about the proposed gas tax and for one would favor a gas tax if we would get a reduction on auto license, the same as some states have. It the state and counties would use some economy taxes would be lower. I do not think that there is need for over fifty members on the public utilities commission and an auto for the department bought with the taxpayers' money. The Governor has an auto bought the same way, as well as others. The state health department has over 100 persons employed, unnecessary is it not? The gas tax and auto license ought to retire highway bonds and state expenses without a general property tax. That would abolish the state tax commission and may the Lord speed the time.—W. B. E., Blaine, Mich.

BLAMES FARMERS FOR SHORTAGE OF HELP

TO the Editor:—I noticed in a recent issue of M. B. F. an article on farm labor, and its inefficiency and scarcity, and having worked nineteen years on different farms in Livingston county, state of Michigan, I think I discovered some of the reasons of the present day scarcity of farm labor. One, and the most important reason is that 99 out of every 100 farmers hire a man the same as they buy a piece of machinery; not to go until he is started, and then keep going until he is stopped, and after he has had fuel put in his tank and water in his radiator, he is supposed to run until stopped again, and he isn't supposed to get sick, but should be on the job every day and must hold himself in readiness to look after thinks Sundays, if the boss so desires. Another reason is that he isn't supposed to have any brains, and is never consulted about the work, just do what he is told to do. Still another reason is that from the time he starts working for a boss until he is fired or quits or his time is out, he has no time for himself, or if he is a married man, no time to be with his family, only nights, and often then, only from 10 o'clock at night until 4 o'clock the next morning. Still another reason, is the living quarters that some bosses furnish for their hired help to live in.

I know a man in this county that is a very prosperous farmer and hires help each season. Has a fine large house, a large barn, an up-to-date hog house, and for the hired help he has a bunk house, just 10 feet from the hog house. This bunk house is about 10 feet by 12 feet and there are sleeping quarters for 8 men, a stove, and that is all there is in it, besides bunks are built on top of one another around the outside. I once helped this man a few days and it didn't look as if this bunk house had been swept or cleaned since it was built. Of course these conditions do not always exist everywhere, and all together, but it causes a man to think twice before hiring himself to a man he doesn't know. I have done it, so I know.

Now, on the other hand, if a hired man was to be considered human and allowed a little time for himself, or his family, and was to be consulted about the work on hand, and if his advice proves to be right, tell him so, and if he be furnished good clean living quarters for himself and family and paid a good living wage, there would not be the scarcity of farm labor that there is today. There are a lot of men like myself that rather than be bought as a machine and considered as such, and herded together as cattle, would rather go to the city and rent a little house of their own, and work in a factory; 8 hours a day are less than 18. Every Sunday is yours. A house you rent yourself is better than 99 percent furnished you on the farm. And if a man develops any brains, he has a chance to use them. One man out of every five is advanced. Not one out of every thousand can expect it on the farm.

After reading this you may think I am a city man. Not so, I am a farmer trying to make a living the same as thousands of others. I have just tried to state some of the reasons why help is scarce on the farm, as I have seen them.—M. C., Roscommon, Mich.

PLENTY OF CHANCES ON FARMS

DEAR EDITOR:—In June 7th issue Thomas T. Ames of Toledo, Ohio, says "The farmer has caused most of the present condition by not recognizing his kinship with labor."

Allow me to suggest that the farer does not lack for a reasonable market price for his goods, but he lets the manufacturing crowd demand of him unreasonable prices—regular war prices—for their goods and force upon our country such prohibitive tariffs that we can't get foreign goods from European factories enough to get even one of the manufacturers four feet out of the feed trough.

Human nature is the same as it has been since Adam, and when the great farm organizations of America said, following Harding's inauguration, to the G. O. P. tariff makers at Washington, that they knew they could trust that great party not to fleece their own pet lambs who had just voted them back into power; then wolf said to brother wolf, "How'll you have your lamb chops fixed, partner?" and lo! verily! each farmer's goods dropped to half price but what he buys is bought at the good old war-prices.—C. H. Merrifield, Gobles, Mich.

TOO MUCH ABOUT COOPERATIVE MARKETING

DEAR EDITOR:—In the past we have taken many different farm papers and magazines and we consider yours well worth the price in a good many ways. But let me advise you that there is something lacking in the Farm Press of America in general, that for five years they have, most of them, did nothing to boost cooperative marketing, and refused to listen to warnings of grafters. Now old business heads like Editors should be, could not help but see and know, how the farmers were being imposed upon by a certain element, that controls most of farmers organizations. I have tried to expose the dangers through several farm papers for several years and only one has responded by printing my articles. I am not opposed to cooperative marketing, if rightly handled, if such a thing could be done, but as it is there are too many high-salaried, white-collared, hangers-on in most of our associations and exchanges and our editors of the American Press know it as well as a big share of the farmers. In my own estimation, and I know I am not alone, farmers would of been much better off today if they had been left alone, all this proposed help and advise costs money. Why pay county agents to learn us to grow more and bigger crops, and also teach a lot of new beginners from city and lumber woods to be farmers, even urge and spend more time teaching the greenhorn to farm, then they spend on the real farmers, why do all this at taxpayers expense when we already grow too much and have too much tax to pay. Why import so much food stuffs from foreign countries? Please find out and tell the American farmers just how much beef and hides, are imported from South America and see if this is not the cause of cheap beef in U. S. and also wool and pork. Saw a short time ago that we bought of South America 4 billion dollars more than we exported to that country outside of coffee and tea. What farm products do we need to buy from South America that will run up to 4 billion dollars?—E. D. Post, Antrim County.

CONSOLIDATED SCHOOLS

TO the Editor:—The writer on consolidated schools speaks of "the little red school house" in the rural districts, must be ignorent of the rural school as there is no such school building. They speak of the poor incompetent teachers in the rural schools. Now are they aware that as smart men as ever were in the halls of Congress got there education up to eighth grade in these rural schools and if the teachers in the rural schools were so inefficient they could not get a certificate to teach. I have nothing to say against the consolidated schools when you get them. But the transportation is a problem to be seriously considered. To get the children up early and ready for school and walk one quarter to one half a mile to the corner at seven o'clock and wait there in the cold and storm, sometimes zero weather, for the carry-all to come, and then ride one hour and a half around the district gathering up the scholars and to the consolidated school is hard on the children for they often suffer with cold feet and get so cold being so long on the way that they are not fit to work for half the forenoon. Now of all articles I have ever read on consolidated schools I have never seen any thing on the transportation part. The consolidated school is fine, but it is the getting there, that is a problem that should be well considered before going into it.—M. B., Berrien County.

"Tea or coffee?"
"Coffee without cream."
"You'll have to take it sir, without milk, sir; we're out of cream."—Puppet.

Butterfield Talks At Elevator Exchange Meet

ASSURANCE that the co-operative marketing work of the Michigan Agricultural College will be increased rather than diminished under his administration was given by Dr. Kenyon L. Butterfield, new president of the college, who addressed the members of the Michigan Elevator Exchange at their fourth annual meeting held at Lansing, July 16th.

After the address, the delegates adopted a resolution commending Dr. Butterfield for his stand on co-operative marketing and pledging the co-operation of the exchange.

The meeting was attended by representatives of farmer's elevator associations holding membership in the exchange, representing 25,000 farmers. H. D. Horton, of Kinde, was elected president; L. C. Kamlowske, of Washington, was reelected vice-president, and Carl Martin, of Coldwater, secretary-treasurer.

The exchange delegates voted to change their type of organization from a membership basis to a cooperative stock company, issuing stock to member elevators in the amount of their membership fee. They authorized a patronage divident from the surplus of $10,000 to be distributed in stock according to the amount of business done through the exchange. The total capital stock authorized was limited to $50,000.

The delegates also authorized the Elevator Exchange to subscribe $20,000 in stock to the Michelex Elevator & Warehouse Co. at Port Huron where the Elevator Exchange is fostering a farmer controlled terminal elevator for bean picking and storage service at cooperative elevators.

The delegates approved the Michigan State Farm Bureau's plan for a reorganization on an endownment plan providing for the establishment of a trust fund for the permanent support of the Farm Bureau.

A comprehensive program of tax reform was adopted, including support for a state income tax, a two-cent gasoline tax and a demand for a fair assessment ratio between city and farm real estate.

The Exchange expressed indebtedness to the Michigan Agricultural College markets department for the marked success the Exchange had attained, and for aid in the establishment of some 700 farmers' co-operative associations in Michigan, most of whom are identified with five great commodity marketing organizations.

The delegates re-elected four directors for two-year periods; L. C. Kamlowske, of Washington; Carl Martin, of Coldwater; H. D. Horton, of Kinde; John Nicholson, of Marlette. O, L. Miner, of Dowagiac, also was elected to the board of directors. Other directors of the Exchange are George McCalla, of Ypsilanti; M. R. Shisler, of Caledonia; F. M. Oehmke, of Bach, and W. E. Phillips, of Decatur.

RADIO DEPARTMENT

EDITED BY J. HERBERT FERRIS, R. E.

TELEPHONE RADIO RECEIVERS

A TELEPHONE receiver consists of a very small permanent magnet around which is wrapped many turns of very fine wire and which then is mounted in a metal or composition case that fits against the ear, and mounted near the magnet but not touching it there is a very thin piece of iron, called the diaphram, which vibrates with the varying intensity of the current that passes through the wire. It is this vibrating of the diaphragm that produces sound which you hear.

Two receivers mounted on a band that fits over the head is called a "headset."

Owing to the delicacy with which the receivers are adjusted for the best results, it is absolutely necessary that they be handled carefully. A fall on the floor may riun them beyond repair.

Receivers are made of varying resistances, such as 2000 or 3000 ohms. This means that the combined pair of receivers, or headset, has wire wound on the magnets with the resistance as stated above. The higher the resistance the more sensitive the receivers are to weak signals, though there is little if any increase in volume with normally loud signals.

Most radio outfits will operate two or more headsets. To obtain the best results the headsets should be alike, or at least have the same number of ohms resistance. It two or more sets are to be used together connect them in series as shown by the accompanying figure.

Some headsets are equipped with cords of two different colors and with such headsets there is usually an accompanying slip telling you to be sure and connect the tip of a certain color to the "positive" terminal of the "B" battery. Where such directions are given they should be followed, for if they are connected wrong, the current will weaken the magnets. If no such instructions came with your headsets, then try connecting them in both ways, that is, reverse the connections and whichever connection gives the loudest response is the way that they should remain.

Do not remove the ear caps unless absolutely necessary, as a very small dent or injury to the diaphragm will spoil the correct distance that separates the diaphragm from the magnets. No dust should be permitted to get between the diaphragm and the magnet; this will prevent the free vibration of the draphragm and decrease the sensitivity.

Most headsets when used on a radio set employing two or more stages of amplification will rattle and not produce as good or true tones as they do on the detector circuit alone. If you want volume, use receivers that are especially made for loud speaker use. This type of receiver has a greater separation between the diaphragm and the magnet and also a different shaped interior sound chamber as well as mounting to prevent the rattle and to give great volume to the sound.

LOUD SPEAKERS

AT the present time there are on the market many types of loud speakers and loud speaker units. The loud speakers are equipped with some kind of a horn, while the units are for use with phonographs or to be attached to a horn.

The loud speaker consists of a special type of receiver that will give a greater volume of sound than an ordinary radio receiver. It is generally of a sturdier construction, heavier and larger than ordinary receivers and will only give good results when attached to a horn of the proper shape and material. The loud speakers use the same type of unit as are sold separately for attaching to a phonograph.

Loud speaker horns should be made of a material that will not vibrate at voice frequencies, or it will tend to rattle and distort the sound as received. Metal horns, unless made of heavy metal or non-vibrating metal, will tend to give a metal or "tin panny" sound to the music or voice. Wood, fibre and the composition horns seem to give the truest tones.

The shape of the horn also affects the sound, as a straight tapered horn will not give the volume as one with a flaring bell on the end. The "goose neck" type of horn has been adapted by the better makers as giving the best results. Every effort has been made to make them of the same shape as the human throat in order to reproduce the voice in a natural manner.

Nearly all of the better loud speaker units will give satisfaction on a radio set having two steps of amplification and using from 60 to 90 volts of "B" battery. Such units are made to fit the standard types of phonographs now on the market and will please as well as surprise you with the great volume that they will give you.

To get the most out of your radio for yourself and friends or family, it will pay you to get a complete loud speaker unit for your phonograph, and in this way you are relieved from the wearing of a headset, which is tiresome after a short time, and all in a room can enjoy the music or talk.

For great volume of sound, for use in schools, churches or halls there is made a special loud speaker that requires a separate battery to excite it, and which will give forth such a large volume of sound that it is too loud ordinarily for use in the home.

Where loud speakers are used there is a slightly greater demand placed on the "B" batteries used on the amplifier than where head sets are used. This will shorten the life of the "B" batteries a very little and should not be an obstable in the way of your having such a loud speaker for use with your set.

COCKADAY CIRCUIT

I wish to take advantage of your kind offer to help amateurs with their radio troubles. I built a set using the Cockaday circuit. I desired this set for its unusual selectivity, unlimited range of distance, ease of tuning, etc., as claimed by some, but mine has none of those fine qualities. As compared with the Haynes circuit which I have been using it has no place. I get only our local stations; Detroit (loud and clear) while with the other we listened to Havana, Cuba, with pleasure.

I am using Cockaday coil, Tett and Kimmel condensers in the stabilizer and secondary windings. They are not the makes called for but are good condensers of the vernier type and correct capacity (.0005). The other parts (Bradley Leak and rheostat) are correct capacity with the exception of two variable condensers in the plate and grid circuits which I made myself and which I think are correct capacity. My tube is 301-A Cunningham. Aerial and ground are good. The aerial is 30 feet high, 150 feet in length, with 30 feet insulated lead-in. I put this set in a black painted box well shellaced inside. Now can you offer any suggestions that will help me? What is your opinion of the Cockaday circuit? Do you think my condensers are at fault? I would not mind the cost if I was sure the set would work right.—Laverne Wallace, Wayne County, Mich.

THIS is a difficulty that many have with this circuit. There is something which we do not know that effects some circuits and not others in a certain locality. Strange that a properly made set of one kind of circuit will give good results, and a really better circuit will give poorer results under exactly the same circumstances. This is sometimes due to inherent faults in the pieces of aparatus used; such as poor insulation, poor dielectric qualities and poor connections.

It is possible that your grid and plate condensers are of the wrong capacity, you may have a very poor connection that holds well but of high resistance. It would be well to trace each wire, resolder each connection as sometimes the flux used gets between the wires and makes a poor high-resistance joint. See that the contacts on the soket are clean and make good contact with the bulb. Try placing your rheostat in the opposite lead of the A battery from the one you now use. Change the B battery conenction so that the negative is connected to the positive of the A battery, if that way now try the negative to negative. (Sometimes one tube works better one way and another tube will work better the opposite.)

Try each change, one at a time, and then test for results. Sometimes it is necessary to reverse the connections of the secondary winding, or the stabilizer winding. Try this first as it seems possible that his may be your whole trouble.

The "Cockaday" circuit has proved good for some, but like most circuits the operator must get accustomed to it in order to get the best results. Let me hear what results you have after trying some of these suggestions.

RADIO PROGRAMS

Station KYW, Chicago. Central standard time 8:20. Wave length 536 meters.

August 19—"What's Doing in Illinois," by H. C. Butcher, Director of Information, Illinois Agricultural Association. "Keynoters," by H. F. Jones, Executive Secretary, Notional Poultry, Butter and Egg Association.

August 22—"Club Work, Farm Prosperity and Business," by Frank B. White, Agricultural Advertisers' Service. "A View of the Live Stock Situation," by D. C. Waterman, Editorial Staff of Orange Judd Illinois Farmer.

"A GOOD MANY cars have come into our part of the country during the past two years equipped with Fisk tires.

"Their owners tell me that they are getting unusual service from them; dealers say they are made by one of the largest and most reputable concerns in the business; from experience I know for our roads it is the best tire I have ever used."

Oh Money! Money!

by ELEANOR H. PORTER

Copyright by Houghton Mifflin Company

(Continued from last issue.)

THE woman dropped her hands from her face and looked up wildly, half defiantly.

"Mr. Smith, you know Fred. You liked him didn't you? He isn't bad and wicked, is he? And they can't shut him up if—if we pay it back—all of it that he took? They won't take my boy—to prison?"

"To prison—Fred!"

"Yes, I know, I know." Impatiently she jerked off the rich coat and tossed it into his arms; then she dropped into the chair again and fell to wringing her hands. "Oh, what shall I do, what shall I do?"

"Oh, I don't know—I don't know," moaned the woman, flinging herself into a chair. "There can't anybody do anything, I s'pose; but I've got to have somebody. I can't stay there in that house—I can't—I can't—I can't!"

Mr. Smith sprang to his feet and hastened toward her.

"Why, Mrs. Blaisdell, what is it? No, she isn't here. I'm so sorry! Can't I do—anything?"

"No, no, of course not. And you shan't," soothed the man. "And she'll be here soon, I'm sure—Miss Maggie will. But just let me help you off with your things," he urged, somewhat awkwardly trying to unfasten her heavy wraps. "You'll be so warm here."

"But what is it?" stammered Mr. Smith helplessly. "Can't I do—something? Can't I send for—for your husband?"

At the mention of her husband, Mrs. Blaisdell fell to weeping afresh.

"No, no! He's gone—to Fred, you know."

"To—Fred?"

"Yes, yes, that's what's the matter. Oh, Fred, Fred, my boy!"

"Fred! Oh, Mrs. Blaisdell, I'm so sorry! But what—is it?"

At the look of horror on Mr. Smith's face, she began to wring her hands again.

"You don't know, of course. I'll have to tell you—I'll have to," she moaned.

"But my dear woman,—not unless you want to."

"I do want to—I do want to! I've got to talk—to somebody. It's this way." With a visible effort she calmed herself a little and forced herself to talk more coherently. "We got a letter from Fred. It came this morning. He wanted some money—quick. He wanted seven hundred dollars and forty-two cents. He said he'd got to have it—if he didn't, he'd go and kill himself. He said he'd spent all of his allowance, every cent, and that's what made him take it—this other money, in the first place."

"You mean—money that didn't belong to him?" Mr. Smith's voice was a little stern.

"Yes; but you mustn't blame him, you mustn't blame him, Mr. Smith. He said he owed it. It was a—debt of honor, Those were his very words.

"Oh! A debt of honor, was it?" Mr. Smith's lips came together grimly.

"Yes; and—Oh, Maggie, Maggie, what shall I do? What shall I do?" she broke off wildly, leaping to her feet as Miss Maggie pushed open the door and hurried in.

"Yes, I know. Don't worry. We'll find something to do." Miss Maggie, white-faced, but with a cheery smile, was throwing off her heavy coat and her hat. A moment later she came over and took Mrs. Hattie's trembling hands in both her own. "Now, first, tell me all about it, dear."

"You know, then?"

"Only a little," answered Miss Maggie, gently pushing the other back into her chair. "I met Frank. Jim telephoned him something, just before he left. But I want the whole story. Now, what is it?"

"I was just telling Mr. Smith." She began to wring her hands again, but Miss Maggie caught and held them firmly. "You see, Fred, he was treasurer of some club, or society, or something; and—and he—he needed some money to—pay a man, and he took that—the money that belonged to the club, you know, and he thought he could pay it back, little by little. But something happened—I don't know what—a new treasurer, or something: anyhow, it was going to be found out—that he'd taken it. It was going to be found out to-morrow, and so he wrote the letter to his father. And Jim's gone. But he looked so—oh, I never saw him look so white and terrible. And I'm so afraid—of what he'll do—to Fred. My boy—my boy!"

"Is Jim going to give him the money?" asked Miss Maggie.

"Yes, oh, yes. Jim drew it out of the bank. Fred said he must have cash. And he's going to give it to him. Oh, they can't shut him up—they can't send him to prison now, can they?"

"Hush, dear! No, they won't send him to prison. If Jim has gone with the money, Fred will pay it back and nobody will know it. But, Hattie, Fred did it, just the same."

"I—I know it."

"And, Hattie, don't you see? Something will have to be done. Don't you see where all this is leading? Fred has been gambling, hasn't he?"

"I'm—I'm afraid so."

"And you know he drinks."

"Y-yes. But he isn't going to, any more. He said he wasn't. He wrote a beautiful letter. He said if his father would help him out of this scrape, he'd never get into another one, and he'd show him how much he appreciated it."

"Good! I'm glad to hear that," cried Miss Maggie. "He'll come out all right, yet."

"Of course he will!" Mr. Smith, over at the window, blew his nose vigorously. Mr. Smith had not sat down since Miss Maggie's entrance. He had crossed to the window, and had stood looking out—at nothing—all through Mrs. Hattie's story.

"You do think he will, don't you?" choked Mrs. Hattie, turning from one to the other pitteously. "He said he was ashamed of himself; that this thing had been an awful lesson to him, and he promised—oh, he promised a lot of things, if Jim would only go up and help him out of this. He'd never, never have to again. But he will, I know he will, if that Gaylord fellow stays there. The whole thing was his fault—I know it was. I hate him! I hate the whole family!"

"Why, Hattie, I thought you liked them!"

"I don't. They're mean, stuck-up things, and they snub me awfully. Don't you suppose I know when I'm being snubbed? And that Gaylord girl—she's just as bad, and she's making my Bessie just like her. I got Bess into the same school with her, you know, and I was so proud and happy. But I'm not—any longer. Why, my Bess, my own daughter, actually looks down on us. She's ashamed of her own father and mother—and she shows it. And it's that Gaylord girl that's done it, too, I believe. I thought I—I was training my daughter to be a lady; but I never meant to train her to look down on—on her own mother!"

"I'm afraid Bessie—needs something of a lesson commented Miss Maggie tersely. "But Bessie will be older, one of these days, Hattie, and then she'll—know more."

"But that's what I've been trying to teach her—'more,' something more all the time, Maggie" sighed Mrs. Hattie, wiping her eyes. "And I've tried to remember and call her Elizabeth, too—but I can't. But, somehow, to-day, nothing seems of any use, any way. And even if she learns more and more, I don't see as it's going to do any good. I haven't got any friends now. I'm not fine enough yet, it seems, for Mrs. Gaylord and all that crowd. They don't want me among them and they show it. And all my old friends are so envious and jealous since the money came that they don't want me, and they show it; so I don't feel comfortable anywhere."

"Never mind, just stop trying to live as you think other folks want you to live, and live as you want to, for a while."

Mrs. Hattie smiled faintly, wiped her eyes again, and got to her feet.

You talk just like Jim. He's always saying that."

"Well, just try it," smiled Miss Maggie, helping her visitor into the luxurious fur coat. "You've no idea how much more comfort you'll take."

"Would I? Mrs. Hattie's eyes were wistful, but almost instantly they showed an alert gleam of anger.

"Well, anyhow, I'm not going to try to do what those Gaylords do any longer. And—and you're sure Fred won't have to go to prison?"

"I'm very sure," nodded Miss Maggie.

"All right, then. I can go home now with some comfort. You always make me feel better, Maggie, and you, too, Mr. Smith. I'm much obliged to you. Good-bye."

"Good-bye," said Mr. Smith.

"Good-bye," said Miss Maggie. "Now, go home and go to bed, and don't worry any more or you'll have one of your headaches."

As the door closed behind her visitor, Miss Maggie turned and sank into a chair. She looked worn and white, and utterly weary.

"I hope she won't meet Frank or Jane anywhere." She sighed profoundly.

"Why? What do you mean? Do you think they'd blame her—about this unfortunate affair of Fred's?"

Miss Maggie sighed again.

"I wasn't thinking of that. I was thinking of another matter. I just came from Frank's, and—"

"Yes?" Something in her face sent a questioning frown to Mr. Smith's own countenance.

"Do you remember hearing Flora say that Jane had bought a lot of the Benson gold-mine stock?"

"Yes."

"Well, Benson has failed; and they've just found out that that old gold-mine stock is worth—about two cents on a dollar."

"Two cents! And how much—"

"About forty thousand dollars," said Miss Maggie wearily.

Mr. Smith sat down.

"Well, I'll be—"

He did not finish his sentence.

CHAPTER XX

Frankenstein: Being a letter from John Smith to Edward D. Norton, Attorney at Law

My Dear Ned:—Wasn't there a story written once about a fellow who created some sort of a machine man without any soul that raised the very dickens and all for him? Frank—Frankenstein?—I guess that was it. Well, I've created a Frankenstein creature—and I'm dead up against it to know what to do with him.

Ned, what in Heaven's name am I going to do with Mr. John Smith? Mr. John Smith, let me tell you, is a very healthy, persistent, insistent, important person, with many kind friends, a definite position in the world, and no small degree of influence. Worse yet (now prepare for a stunning blow, Ned!), Mr. Smith has been so inconsiderate as to fall in love. Yes, he has. And he has fallen in love as absolutely and as idiotically as if he were twenty-one instead of fifty-two. Now, will you kindly tell me how Mr. John Smith is going to fade away into nothingness? And, even if he finds a way to do that, shall he, before fading, pop the question for Mr. Stanley G. Fulton, or shall he trust to Mr. Stanley G. Fulton's being able to win for himself the love Mr. John Smith fondly hopes is his?

Seriously, joking aside, I'm afraid I've made a mess of things, not only for myself, but for everybody else.

First, my own future. I'll spare you rhapsodies, Ned. They say, anyway, that there's no fool like an old fool. But I will admit that that future looks very dark to me if I am not to have the companionship of the little woman, Maggie Duff. Oh, yes, it's "Poor Maggie." You've probably guessed as much. As for Miss Maggie herself, perhaps it's conceited, but I believe she's not entirely indifferent to Mr. John Smith. How she'll like Mr. Stanley G. Fulton I have my doubts; but, alas! I have no doubts whatever as to what her opinion will be of Mr. Stanley G. Fulton's masquerading as Mr. John Smith! And I don't envy Mr. Stanley G. Fulton the job he's got on his hands to put himself right with her, either. But there's one thing he can be sure of, at least; if she does care for Mr. John Smith, it wasn't Mr. Stanley G. Fulton's money that was the bait.

Poor Maggie! (There! you see already I have adopted the Hillerton vernacular.) But I fear Miss Maggie is indeed "poor" now. She has had several letters that I don't like the looks of and a call from a villainous-looking man from Boston—one of your craft, I believe (begging your pardon). I think she's lost some money, and I don't believe she had any extra to lose. She's as proud as Lucifer, however, and she's determined no one shall find out she's lost any money, so her laugh is gayer than ever. But I know, just the same. I can hear something in her voice that isn't laughter.

Jove! Ned, what a mess I have made of it! I feel more than ever now like the boy with his ear to the keyhole. These people are my friends—or, rather, they are Mr. John Smith's friends. As for being mine—who am I, Smith, or Fulton? Will they be Fulton's friends, after they find he is John Smith? Will they be Smith's friends, even after they find he is Fulton? Pleasant position I am in! What?

Oh, yes, I can hear you say that it serves me right, and that you warned me, and that I was deaf to all remonstrances. It does. You did. I was. Now, we'll waste no more time on that. I've admitted all you could say. I've acknowledged my error, and my transgression is ever before me. I built the box, I walked into it, and I deliberately shut the cover down. But now I want to get out. I've got to get out—some way. I can't spend the rest of my natural existence as John Smith, hunting Blaisdell data—though sometimes I think I'd be willing to, if it's the only way to stay with Miss Maggie. I tell you, that little woman can make a home out of—

But I couldn't stay with Miss Maggie. John Smith wouldn't have money enough to pay his board, to say nothing of inviting Miss Maggie to board with him, would he? The opening of Mr. Stanley G. Fulton's last will and testament on the first day of next November will effectually cut off Mr. John Smith's source of income. There is no provision in the will for Mr. John Smith. Smith would have to go to work. I don't think he'd like that. By the way, I wonder: do you suppose John Smith could earn—his salt, if he was hard put to it? Very plainly, then, something has got to be done about getting John Smith to fade away, and Stanley G. Fulton to appear before next November.

And I had thought it would be so easy! Early this summer John Smith was to pack up his Blaisdell data, bid a pleasant adieu to Hillerton, and betake himself to South America. In due course, after a short trip to some obscure Inca city, or down some little-known river, Mr. Stanley G. Fulton would arrive at some South American hotel from the interior, and would take immediate passage for the States, reaching Chicago long before November first.

There would be a slight flurry, of course, and a few annoying interviews and write-ups; but Mr. Stanley G. Fulton always was known to keep his affairs to himself pretty well, and the matter would soon be put down as merely another of the multi-millionaire's eccentricities. The whole thing would then be all over, and well over. But—nowhere had there been taken into consideration the possibilities of—a Maggie Duff. And now, to me, that same Maggie Duff is the only thing worth considering—anywhere. So there you are!

And even after all this, I haven't accomplished what I set out to do—that is, find the future possessor of the Fulton millions (unless Miss Maggie—bless her!—says "yes." And even then, some one will have to have them after us). I have found out one thing, though. As conditions are now, I should not want either Frank, or James, or Flora to have them—not unless the millions could bring them more happiness than these hundred thousand apiece have brought.

Honest, Ned, that miserable money has made more—But, never mind. It's too long a story to write. I'll tell you when I see you—if I ever do see you. There's still the possibility, you know, that Mr. Stanley G. Fulton is lost in darkest South America, and of course John Smith can go to work!

I believe I won't sign my name—I haven't got any name—that I feel really belongs to me now. Still I might—yes, I will sign it

"Frankenstein."

CHAPTER XXI

Sympathies Misplaced

The first time Mr. Smith saw Frank Blaisdell, after Miss Maggie's news of the forty-thousand-dollar loss, he tried somewhat awkwardly, to express his interest and sympathy. But Frank Blaisdell cut him short.

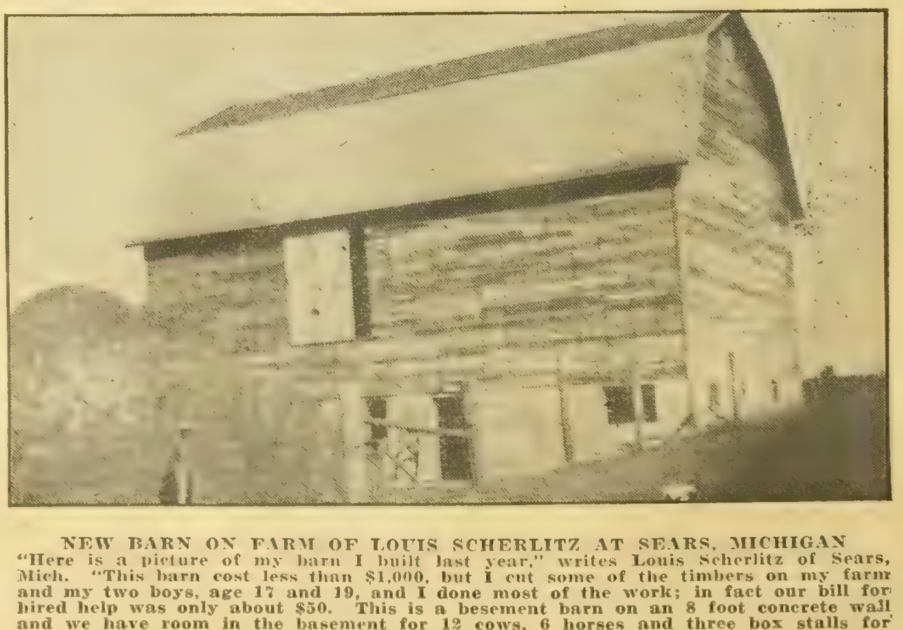
"That's all right, and I thank you," he cried heartily. "And I know most folks would think losing forty thousand dollars was about as bad as it could be. Jane, now, is all worked up over it; can't sleep nights, and has gone back to turning down the gas and eating sour cream so's to save and help make it up. But me—I call it the best thing that ever happened."

"Well, really," laughed Mr. Smith; "I'm sure that's a very delightful way to look at it—if you can."

(Continued in Aug. 30th issue.)

OUR READERS' NEW BUILDINGS

Have you built any up-to-date farm buildings lately? If you have send us a picture of the new building and we will print it in this new department. It will show the M. B. F. readers what their distant neighbors are doing to change the scenery. And, incidently, you may be able to help some farmer decide the type of house, or barn, or other buildings he desires to put up. He may like the appearance of your building and will want the plan of it. Kodak pictures are all right if the details show up well. Do not send the negative, just a good print.



NEW BARN ON FARM OF LOUIS SCHERLITZ AT SEARS, MICHIGAN

"Here is a picture of my barn I built last year," writes Louis Scherlitz of Sears, Mich. "This barn cost less than $1,000, but I cut some of the timbers on my farm and my two boys, age 17 and 19, and I done most of the work; in fact our bill for hired help was only about $50. This is a besement barn on an 8 foot concrete wall and we have room in the basement for 12 cows, 6 horses and three box stalls for cows. This barn is 34 feet by 50 feet and has a 16-foot drive in the center with a mow on both sides. I have a storage tank for water under the approach to the barn."

A NON-RESISTANT CHRISTIANITY

A SERMON BY REV. DAVID F. WARNER

TEXT: "Ye have heard it was said, An eye for an eye, and a tooth for a tooth: but I say unto you, Resist not him that is evil: but whosoever smiteth thee on thy right cheek, turn to him the other also." Matthew 5:38, 39.

WHAT saith the law? Well, ye have heard that Moses said, "An eye for an eye and a tooth for a tooth." As God's legislator he was declaring the legal punishment due the evil doer. Constituted legal authority was to bring punishment upon law-breakers that the community might be protected. And this will always attach to the power of the state. So, the law of Moses was a friend to mankind. It was stern; and aimed, also, to bring men to see wrong-doing and emphasize the wrong of the doing. Then its work was done. Its mission was to bring men to Jesus' way which was creative and regenerative.

But we are not appreciating the responsibilities and privileges of Christ's way of life. Under the old law, social violations were settled by public judges. Under the New, Jesus makes each individual his own judge. As, "If thine hand offend thee, cut it off" yourself. It is a far step from the old to the New; from law to Grace; and from bondage to Freedom, where a personal religion of new and brotherly desires works unchecked. "Resist not his that is evil," for example, is a principle that Jesus worked out in life and on the Cross, in anticipation of teaching men such a spirit of brotherhood that the law against retaliating will not be broken. Some folks have been willing to make Jesus a drudge to carry their sins and sorrows, but have refused to take delight in his ways, which are social and unselfish. Here are recent words from a prominent Christian prophet: "I fling this out as a challange to the princes and leaders of the earth, to captains and leaders of labor and industry, to the bosses of political parties, old and new, to presidents and governor, to the average man: Unless and until this Nation and this world of ours comes to Jesus' way of thinking about life, there will be hatred, suspicions, jealousies, strifes, and wars."

Christian grace rises so far above Mosaic Law that retaliation and all selfish resistance is swept away entirely. And the great question is not, "An I right in holding to a religion of non-resistance?" But, "Am I obeying the way of Christ?" To resist not evil means as indicated in the illustrations of the text and context. Turning the other cheek and going the second mile, is not only non-resistance, but it is meeting resistance with love. Jesus is here advancing to the greatest thing in the world, LOVE. "Love your enemies," saith he. This Love does not resist, but "beareth all things." And bless God, many individuals today, both known and unknown, are living this miracle way. But the world is yet waiting for the nation that will be used of God to form its ideals and live its life around Love.

The disposition that does not nurse or coddle the desire to hurt or seek revenge, is that which keeps us out of war. War is entirely foreign to the ethical teaching of Christ. It is time we are checking up on some of this modern philosophy of life. Jesus is saying that retaliation will not save men's souls or vindicate social righteousness. "My kingdom is not of this world or else would my servants fight." The kingdom of God is to brought about by the moral resistance of love and kindness. Nothing else can produce character in an individual or righteousness in a nation. A daily paper says, "Marching thousands (of soldiers) show love for their native land." We hope so. But, how be it, that the martial spirit is not necessarily synonymous with patriotism. And the writer believes that the militaristic temper is in obvious contradiction to the temper of Christ; and he here avers, that the call by our Secretary of War, for a national Mobilization Day next September, is seriously disturbing to the present day efforts of churches and Christain forces to bring about the outlawry of war. When will we come to admire that sovereignty of Christain conscience that does not truckle to Mars, that religion that does not yield to worldly policy, and that passion to put to work the teachings of the Nazerene, and suffer and bear, until they are realized in a large and universal sense?

Jesus Christ intends that the law of non-resistance shall hold, not only between men as individuals, but between men as groups or nations. This is comprehended in "Make disciples of all nations," and "he made of one every nation of men to dwell on the face of the earth." We shall always believe that His Gospel is to Christianize and unify the nations. This ideal is, even now, the heart cry of the world. The pending resolution to outlaw war, introduced in the United States Senate by Senator Borah, may be timed to meet this cry. Let Christian America get back of it. Men who are deliberately opposed to such political organization against war, are blind to the spiritual tendency of world events; but above all to the moral purposes of God which are eternal and fixed. With the confusion of peoples and issues today, God has pleased to entangle us that we might have the responsibility and high privilege of pointing the way out, of setting to work the rule of non-militarism among nations. Then, the writer would urge our church power to the support of the Borah resolution. This resolution lies before me on my desk and I find it contains some vital principles. Here is one: "Further use of war as an institution for the settlement of international disputes, shall be abolished." Here is another: "Every nation should by agreement or treaty, bind itself to indict and punish its own international war breeders, or instigators and war profiteers." The resolution is reasonable in its demands and pacifying in spirit, and why not return men to the Senate who will support it?

Again, a few more intimate words. We are to believe that resisting the evil-doer is most effectually done thru not resisting. This acts like "coals of fire upon the head." We don't know just how it works, but it must start up a flame of fire that burns up hatred and malice. This turning the other cheek calmly takes the threat out of the other fellow's fist. And you will recall that Jesus in the hands of his foes, was as "a lamb led to the slaughter, yet he opened not his mouth," only to say, "Father forgive." We are to believe that such a reality of love and non-retaliation is to become irresistible in its power to cover the earth.

But ought we never to resist? Well, be sure any limit is found in the principle itself, which involves doing good to others. Physical resistance which does the enemy good and protects the helpless and innocent, would seem to be permissible, But any resistance must not run to killing.

Now, the challange is, to bring our hearts under dominion to this gentle teaching. It is the Golden Rule way of living, and workable on the part of individuals or nations as they yield to the non-violence of Christain brotherhood. It assumes a Christianity, not static or at ease with itself; but dynamic and capable of exalting peace and good-will toward men.

BE KINDLY AFFECTIONED one to another with brotherly love; in honour preferring one another; recompense to no man evil for evil. Provide things honest in the sight of all men. Be not overcome of evil, but overcome evil with good.—Romans 12:10, 17, 21.

* * *

THOU ART MY LAMP, O Lord: and the Lord will lighten my darkness. For by Thee I have run through a troop: by my God have I leaped over a wall.—2 Samuel 22:29, 30.

* * *

TRUST IN THE LORD with all thine heart; and lean not unto thine own understanding.—Proverbs 3:5.

PICTURES YOU'LL PRIZE

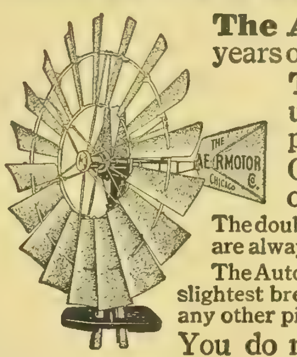
Kodak at the Fair

Fair time means vacation time to you and your family, and that means Kodak pictures as a matter of course. Everybody takes a Kodak on vacation.

You'll make pictures of the picnic along the roadside, of prize stock at the fair grounds, of your own entries in county or state competitions. Then as the years go by, the prints in your Kodak album bring back the fun you had.

Autographic Kodaks $6.50 up. "Kodak on the Farm," just off the press, is free at your dealer's or from us.

Eastman Kodak Company, Rochester, N.Y.



The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

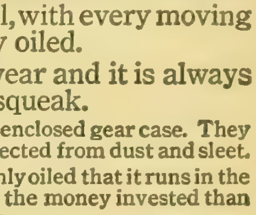
The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

AERMOTOR CO. Chicago Kansas City Dallas Minneapolis Des Moines Oakland



HOLDEN Lime and Fertilizer Spreader

Sour soil means poor crops. Experts agree fertilizer is useless on sour soil—it must have lime. The "Holden" Spreader makes bigger crops. Guaranteed to handle lime in any form, fertilizer, phosphate, gypsum, wood ashes or crushed shells.

Soil Tested-*free*

What about your soil?-your crops? Are they big and sturdy as they should be? Find out today with our free Litmus Test Papers—positive sour soil test recommended by all soil experts. Write for them now.

THE HOLDEN CO., Inc.
Dept 264 Peoria Illinois

Cannot Clog. Try Spreader 10 days Free. The Holden Lime and Fertilizer Spreader will make your soil healthy and productive. Spreads twice as far as any other; 16½ ft. Attaches to any wagon or truck. No holes to bore. Spreads evenly 100 to 10,000 lbs. per acre Handle material only once, from car to field. Get literature and low prices now and ask about 10 Day Free Trial.

SPREADS 16½ FEET

GOLD CORN HARVESTER Worth its weight in gold to every farmer raising corn, cane and kaffir in rows. Only $25 with bundle tying attachment. Testimonials from pleased customers in every state. FREE catalog showing pictures of Harvester. PROCESS MFG. CORP., SALINA, KAN.

In every case when writing say: "I saw your advertisement in The Michigan Business Farmer!" It will guarantee honest dealing.

"The Farm Paper of Service"

HOW ARE THINGS IN EUROPE?

FOUR weeks in France, Switzerland, Germany, Belgium, and England do not entitle one to pass an expert opinion on European conditions that may be considered infallible and yet we might be quite as well qualified to pass judgment as are many of the senators who return from their junkets as members of so-called investigating committees.

We arrived in France on the twentieth of June and left England on the twenty-third of July and, in a nutshell, we were impressed by the following facts which we may allude to more fully in future issues:

All of the countries mentioned appear prosperous. England alone has a great unemployment problem, and the resulting unrest she is erroneously trying to appease with a weekly "dole" that is building only an army of beggers. Belgium is practically rebuilt and is now engaged in doubling her forts along the German border to preclude an invasion, which they assume must come again. France in attempting to extract "the pound of flesh" has lost the support of England and the sympathy of America. Belgium is playing a minor part in this game France has so stubbornly attempted. Only the happy solution which seems to have attended the meeting just held in London to consider the Dawes plan could have prevented France from plunging headlong over the abyss of another great war, in which, who knows, but what Germany would have had the resources of Russia, that great enigma nation of the north, for her own.

The people of England are determined to win the friendship of the United States even at the cost of some of their self-esteem, knowing that the two great English speaking nations thus united would stand like Gibralter against the rest of the world. No American in England this summer can fail to be impressed with this fact and his visit to the great British Empire exposition at Wembley will convince him that such a merger of resources would not be one-sided.

With the exceptions of France and Belgium, where the world's attitude towards them is reflected in the low rate of their exchange, the dollar is worth little more in Europe than it is here. Germany has turned a handspring with her deflated currency that has placed it, almost overnight, where is stood in 1914. We paid two Renten marks, each worth 25 cents in U. S. currency, for two peaches in Cologne-on-the-Rhine!

We went over on the "Leviathan," the world's largest passenger vessel, which, taken from the Germans, carried more than a million troops to France during the war. We came back on the "George Washington," which bore the same name when she was under the German flag and the ship that proudly carried out late President on his great and ill-fated crusade. Both ships are well patronized by Americans. It seemed good to see an American flag flying on the breeze and to know that the men who manned them were U. S. naval reserve officers ready to place these great ships in transport service in time of war. With the great markets in Germany and elsewhere for our livestock and foodstuffs opened again, the farmers of America will have something to be thankful for, in the fleet of American vessels now available, thanks to the farsighted devotion of the men who have directed the United States Shipping Board.

* * * *

We will, if you who read this page are interested, have more to say about European conditions in other issues, and for a detailed story of the trip made by our group of agricultural editors and publishers, we have arranged for a series of articles by Mr. Floyd Flood, a thoroughly trained farmer and breeder, to begin in the next issue, with his observations at the Royal Stock Show in England.

THE GRAIN MARKETING COMPANY

WE will watch with more than passing interest the actions of the Grain Marketing Company, that twenty-six million dollar baby, to which the American Farm Bureau Federation has just given birth.

The company went into operation on August first with branches at Chicago, St. Louis, Kansas City, New York, Buffalo, Norfolk, Fort Worth, Galveston, Minneapolis, and Milwaukee, its officers are Gray Silver, Martinsburg, West Virginia, president; Harry L. Keefe, Walthill, Nebraska, first vice-president; G. M. Dyer, Spencer, Iowa, second vice-president; and John W. Coverdale, Ames, Iowa, secretary-treasurer.

The men named are not unknown to the farmers of the United States and bear good reputations in every instance, so far as we know. The question is whether they have had the experience which will enable them to direct the marketing operations of a company which in potential capitalization rivals some of the largest and best known corporations in the United States.

The opponents of the present plan claim that there has been a large shrinkage in the valuation of the propertiies which the new company proposed to take over, and that this is simply a scheme to unload some unprofitable property on the farmers of the United States who have been working so diligently the past two decades to improve their marketing facilities.

The present plan is a stupendous one and we do not wish to be understood as in the least criticising the methods of the present organization or the almost Eutopian aim which its founders have set as its ultimate goal. We are charitable and have supported every cooperative proposition which has been presented to the farmer, but we must admit that the present one appals us a little. We feel like the man on the sidewalk in front of the Woolworth building being asked how he likes the building. We will have to get off at a perspective of several months before we will be able to give a true picture for the benefit of our readers, and we have an idea that most of the sound thinking business farmers in Michigan will harbor very much the same idea.

FARMERS' DAY AT M. A. C.

EVERY year the number of farmers who attend Farmers' Day at M. A. C. see a new record set, and the Seventh Annual affair held last week was no exception.

This is a good sign. It proves that farmers have come to see that there is something more in farm life than the mere gathering together of more acres and more dollars, which usually bring with them more trouble to the farmer and his family.

We have no time for the loafer but we do admire the man who with the help of his family works a few hours extra several days in advance and then hitches up his automobile and takes the whole crowd to the Farmers' Day, picnic, fair or whatever it is that will contribute to their lives and well being.

The program prepared for Farmers' Day at Lansing, this year, was one of the best that the college has ever given for the benefit of its guests, and a great deal of credit is due to the active heads of the college for their good work and painstaking plans for the success of this year's big day.

It would have been worth your while to have seen the big crowd gathered around the "Old Timers' Mowing Contest," and the beam of satisfaction on the face of the winner was worth a trip all the way to Lansing to see.

That there is more occasion for smiles in the present indication of farm prices and farm crops was easily seen in the faces of men and women who came from farms in all parts of Michigan. They had something to be thankful for, especially when they passed groups of factory workers standing before the employment windows in Lansing, looking for "a job."

MASSACHUSETTS' LOSS OUR GAIN

THAT the Massachusetts Agricultural College is genuinely sorry to lose Kenyon L. Butterfield, who comes to the Michigan Agricultural College, as president September first, was expressed by Director John B. Willard on the occasion of Dr. Butterfield's public retiral. "It is with genuine regret that we present him for the last time as our president. For eighteen years Massachusetts farmers have had the leadership of the foremost agricultural thinker in the United States."

Into his valedictory Dr. Butterfield packed his whole philosophy of country life. He spoke of "the permanent abiding problems farmers must always face." Of all these problems, the one he most emphasized was the lack of study and discussion among rural groups. He deplored the decay of the lyceum and the old-fashioned village store debating society. "There is a tendency today not to participate in the debate that draws out the individual. We have somebody else think for us and talk for us. The whole tendency of the times is to be so busy that we get only second-hand fragments of discussion." He saw this lack of study and discussion most apparent among farm people.

The farmers' political activity he evidently regards as not deeply significant, because, he explained, all the farmers cannot come together in a political party; farm people in different sections have interests as diverse as industrial and mercantile groups. But he believed the farm group could and ought to unite on certain political fundamentals. The chief of these was their attitude toward the peace of the world. "I doubt if any group of people in the world is as set in the interests of world peace as the farmers. Yet I doubt if in any other group peace problems are as little discussed.

"If the farmers and the college people do not look out it will not be long before the labor group in this country will be the best educated group in America; because the forum idea of study and debate is taking hold in this group as in no other. It is a development that ought to be at the root of interest in a democracy."

Dr. Butterfield's remarks may or may not be as applicable to Michigan as they are to Massachusetts; this fact he will soon have an opportunity to determine. Awfully sorry, Massachusets, but we need Kenyon at home now!

A MASTER STROKE

THIS week we are going to hand the palm to our good friend A. B. Cook, master of the state grange, who in a newspaper report states that if the Wayne County automobile interests initiate a referendum on the proposed two-cent gasoline tax, he will for the Grange initiate a referendum for a three-cent tax!

It is pretty well admitted that the gasoline tax in Michigan is an assured fact, and according to Mr. Cook the opponents are initiating a referendum simply to stall for time, so he proposes to retaliate by getting an even larger tax than was first proposed and we have no doubt but that will be as easy to get three as two cents per gallon.

We have always admired friend Cook but we never knew he had so much sagacity. His present ruse would do credit to a Yankee lawyer and from Connecticut, too!

LIVESTOCK PRODUCERS WIN

ACCORDING to a report just published for the first six months of the year, 1924, livestock producers at the various terminal markets have shown a saving to members of nearly $400,000.00. In the Chicago market alone more than $13,000,000 worth of livestock was handled and at St. Paul nearly $12,000,000.

Where are those men who said cooperation never could succeed in the United States? Cooperation will always succeed when the men behind it are honest and efficient and the individual members stick to it through thick and thin.

Gradually the farmers of this country are learning this fact!

FAREWELL, PITTSBURGH PLUS!

THE old "Pittsburgh Plus" hoax has gone down to an inglorious defeat and the farmers of America pray that it may never be re-established no matter what the conditions were that forced it on an unsuspecting public.

Statisticians claim that the abolishment by the Federal Trade Commission of this "ficticious freight" item will save the farmers in the middle west $30,000,000.00, and make Gary, Indiana, the center of the steel industry in America.

Michigan alone it is estimated will save $2,000,000.00 each year; Illinois, $3,500,000.000; Wisconsin, $3,000,000.00; Indiana, $2,500,000.00; Minnesota, $2,500,000.00, and most of this is represented in the added cost of freight on all articles manufactured of steel which the farmer uses in his business.

This is a step in the right direction and one which has taken the united effort of the agricultural associations, organizations and press to deal the final blow. It is all over now and you should begin to feel the effects of it when you buy machinery.

PUBLISHER'S DESK

PLEASE SIGN YOUR COMPLETE NAME AND ADDRESS

IN our June 7th issue I wrote about your signing your complete name and address when writing to us or sending in your subscription. Our circulation manager just told me that he continues to receive letters with only the name signed. Some times he is able to get the post office address from the envelop and again other times it is not printed clear enough to be readable—and then the subscriber wonders why he doesn't get his paper, while we wonder if he will write in so that we can get his full address to send him his BUSINESS FARMER. Please remember we want YOUR COMPLETE NAME AND ADDRESS and sign it plainly.

LOOK OUT FOR PICTURE ENLARGEMENT SHARKS

THE picture enlargement sharks have been letting the farmers of Michigan alone since we exposed them and we heard nothing about them for quite a while but now we are getting reports from different parts of the state that they are back again and up to their old tricks.

They come to your door and ask if you have a photograph of a child or relative that you would like to preserve. They try to learn from your neighbor if you have lost through death a child or a close relative and when they call they ask you for a photograph of the child or relative and then proceed to work on your sympathy. You bring the photograph and they become enthusiastic over the possibilities of enlarging it and show you how their company enlarged one for Mr. So-and-so "and the photograph wasn't near as good as the one you have." The picture is in a frame and they promise to enlarge your photograph "just like this one" and deliver it to you for a fixed amount, usually ranging from $3 to $5.

You are asked to sign an agreement, which, while it does not bind you to accept a picture in a frame, it does obligate you to pay for the enlargement. When delivery is made you find they have placed the picture in a frame and you are asked to pay a fancy price for the frame. The price for the frame ranges from $15 to $3; if the purchaser will pay the top price all right but if he will not they reduce the price and even at $3 they make money on it.

If one of these agents calls at your house sic the dog on to him. If you want to have a photograph enlarged go to a reliable photographer in the nearest town and have the work done properly and at an honest price.

OFFICERS OF CHICAGO WHOLESALE SEED COMPANY INDICTED

"I woud like to know if you could help me out with a deal I had last winter and spring with a mail order seed house. It was the Chicago Wholesale Seed Company. They wanted me to represent them in my territory and take orders for grass seed. In the deal I gave them my order for clover seed amounting to $45.00 and about $35.00 worth of this seed wasn't fit to sow. I had it retested and one lot was condemned for sale in this state. I wrote them about it and they have not made me any reply about the seed. They owe me $9.00 commission and say they haven't the money to pay up all their debts and want to give a note for 2 years at 7% interest. They sent a note to be filled out and I wrote them but have received no answer. I received a letter from the post office inspector at Chicago asking if I had had any dealing with this company and if I had to send the papers to him. This I did and I have not heard from him.

YOU are "out of luck" as the officers of the Chicago Wholesale Seed Company were indicted on May 29th, 1924, for using the mails to defraud farmers and agents. The principal officer is Edwin L. Rosenberg, who formerly operated the World Seed Company of Milwaukee, the St. Louis Seed Company of St. Louis, Mo., the Lawrence Seed Company of Kansas City, Mo., and other seed companies at Milwaukee, Wis. He has been in this business for a number of years, and the banks at Milwaukee suffered a tremendous loss several years ago because of his manipulations. For years he has been defrauding farmers and agents through his seed companies, the post office officials declare.

The Collection Box

The purpose of this department is to protect our subscribers from fraudulent dealings or unfair treatment by persons or concerns at a distance.

In every case we will do our best to make a satisfactory settlement or force action, for which no charge for our services will ever be made, providing:

1.—The claim is made by a paid-up subscriber to The Business Farmer.

2.—The claim is not more than 6 mos. old.

3.—The claim is not local or between people within easy distance of one another. These should be settled at first hand and not attempted by mail.

Address all letters, giving full particulars, amounts, dates, etc., enclosing also your address label from the front cover of any issue to prove that you are a paid-up subscriber.

FIGHT OPTICAL QUACKS

A WARNING that the eyesight of thousands of persons is being jeopardized by mail order houses specializing in eye-glasses has been sent out by the National Committee for the Prevention of Blindness. Admitting that there is apparently no way of prosecuting these firms because of the legal technicalities behind which they can shelter themselves, the committee holds that the only way of combating the menace is a campaign of education, and this has been started.

Widespread sales campaigns are being conducted by the firms accused, according to the committee, and glasses are being sold "without the slightest sort of an examination of the eye of the prospective purchaser and without even an inquiry as to the condition of the eyes.

"These optical quacks ask merely 'How old are you?' " the warning continues, " 'How many years have you worn glasses, if any?' and 'What is the shape of your face, round or slender?' and upon this information they offer to fit any person with glasses promising 'the most perfect vision of any lenses you can get.' 'These splendid glasses,' read the circulars which are being sent out by the tons, 'will enable anyone to read the smallest print, thread the finest needle, see far or near and will prevent eye-strain and headache.'

"The mail order houses play upon the vanity of their prospective customers, all of their advertising emphasizing in particular the beauty of their product and the improvement in appearance they will bring to the wearer. The 'handsome shell rims' give anyone a 'younger, yet more distinguished appearance,' say the circulars. Cheapness of price is of course another bait. Preminums, such as sewing shears for women and leather billfolders for men are often offered as a special inducement to buy.

"Investigation has shown that the glasses which are actually sent are simply a fair grade of magnifying glasses mounted in an extremely poor grade of frame. These are advertised as 'scientifically ground and curved lenses.'

"The glasses do nothing that the exploiters claim for them. They simply make the print look larger; as a consequence many persons receiving them, particularly old people with failing eyesight, will worry along with them, occassionally feeling satisfied because of their own ignorance of the harm that is being done their eyes and lack of knowledge of what proper fitting of glasses require."

Dear Sir: Received a card again in regards to ———— settlement. Have received my money at last and a thousand thanks for your effort or I would never received a cent as I had written so many times. I will close, thanking you again for your trouble.—M. D., Woodland, Mich.

County.. State ....

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

DEAR FOLKS: Before another issue the State Fair will be under headway, and most of us will be getting our exhibits ready for our own county fair. The fair is a wonderful institution and we should all do our part to make our fair (we all attend a certain fair each year and feel a personal interest in it) better each year. It is here that we women enter our best canned fruit, some fancy work, etc., into friendly competition with our neighbors. If we fail to win first prize we are determined to do better next time. Father takes special care of a calf that he intends to enter and he says he will "win first prize or bust a tug". If Neighbor Brown's calf is just a little bit better according to the judge (but not father) and father loses out, father says to Brown "You beat me this year but you won't next." The result is father improves the livestock, and the same is true of grains and produce.

Let's all boost the fair. And try to attend the State Fair this year, Aug. 29-Sept. 7. Plan one whole day at least and two if possible.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

GETTIN' HOME AG'IN

been away off yonder where the stylish people go
en summer days are br'ilin' hot, to spend a week or so;
Off yonder where the city runs right down into the sea,
Where everything is noise an' fun an' style an' gaiety.

An' tho I seed a lot of things I never seed before,
An' tho I did a lot of things I mustn't do no more,
An' tho I had a roll o' cash, an' freely blowed it in,
The sweetest part of all my trip was gettin' home ag'in.

An' now I'm back at home ag'in an' knockin' 'round the place,
An' every old familiar spot seems like a friendly face;
The hogs, the horses, and the cows, all seem to know me, too,
An' every rooster on the farm is crowin' "How-de-do!"

There ain't no other spot o' ground betwixt the pole an' line
That seems to grip the soul o' me like this old farm o' mine,
An' if I make the Golden Gate, an' Peter lets me in,
I'm 'fraid I'll even worry then 'bout gettiin' home ag'in.

—Whitney Montgomery.

GROPING

WE are restless creatures, never at peace with ourselves, never content with out lot, ever in search of an abiding-place and finding no rest for the sole of the foot. The birds of the air and the beasts of the field take no though, but only man searches and questions and will not be stilled.

"Who is God?" asks the grave-eyed self. I don't know. I look into the sky on a night when it is deep blue, filled with swimming stars. Over my head arches the Milky Way: a spray of star-dust shot through with millions of gleaming stars—a gesture of the Creator.

Low in the sky rides the cool, shining moon, flooding the earth with light indescribable, throwing shadows purple black under the trees, creating a fairy world for lingering lovers. I look with wonder-startled eyes, but no hint of the matter comes to me. I would gather and hold to me a glint of this beauty. But the light wind of morning wafts it away with the promise of other loveliness.

Close to the old rail fence stands a cluster of mallows that glow in the sun, each huge flower of a texture and sheen beyond the skill of mortal weaver, of a line and form that fills the heart of the artist with adoration and despair. Gay, taunting, aloof and bewiching they grow by the old rail fence. I stand beside them in wistful silence. They are of God. I can know no further.

"True," says the prodding soul, "the loveliness of this earth is past knowing, but why am I here? I work and I play; I suffer agony and again rejoice greatly. I pass away as I came, a lonely, questing stranger, groping endlessly. Why?"

I don't know. On the plains of Judea there was born in a manger a child of poverty. A star lighted his birth and sank from sight. He struggled and lived—a man of sorrows, acquainted with grief. He was blameless; there was no fault in Him—yet He died the death of a malefactor. Died, and lives always.

Countless hosts of men have come here asking the same question and answering it by their eager desire to live high-spiritedy, holding hard to their deep-rooted faith in the immortality of their living.

"Ah, but what is life that we cherish it so? What is it that defies time's effort to bind it; that eludes pursuit, only to return and return eternally when we have ceased to be concerned?"

Once the students of a famous laboratory pressed their master for an answer and he set them a problem: "Take these barley-corns and analyze them. Now make some barley-corns complete, perfect, in their chemical elements. So. Now I shall plant some barley from my field and do you plant the barley of the laboratory and we shall see."

From the barley of the field came new barley, but from the scientists' barley came no sign save silence. "What, then, did you leave out of your barley? Certainly no material element. 'Twas the life germ, the breath of the Creator."

We believe. We trust. We have faith in this breath of life that is breathed into our souls directly from the soul of the Creator—and we know we are here for some destined end and good. For God would have it so, and God is good.—Angelo Patri.

(Editor's Note:—We are indebted to the Delineator for the above. I think it is so true, don't you?)

BOBBING HAIR WILL NOT MAKE IT GROW

DON'T bob your hair to make it grow faster! Bobbing the hair for esthetic reasons is quite proper, providing your mother, your husband, or your grandchildren do not object, but says Dr. Herman Goodman in Hygeia:

"Cutting the hair (table talk to the contrary), does not improve its growing qualities. Under general conditions, it takes a hair about six weeks to grow one inch.

"However, not all the hairs of the scalp, even if uncut, would grow to the same length. On the crown and the back of the head, the hair may grow 40 to 50 inches and be not unusually long, while at the sides 18 inches is generally the limit. In men, of course, such long hair is very uncommon and with the fashion, it becomes increasingly unusual among women."

Dr. Goodman makes another statement, surprising to the uninitiated. The years when the hair grows most quickly, he says, are those between 35 and 60.

If you find a hair on your coat collar, don't get nervous, this hair specialist advises. The hair is continually shedding and regrowing and in the healthiest of persons a hair grows old, is lost, and a new one takes its place.

Only when the number of new hairs runs behind the number of fallen ones, should one become alarmed. The thing to do them is not to consult the barber, the drug clerk, or the hair dresser, but to go to a physician who can find out the cause of the falling hair and can start prompt treatment to restore the scalp to a healthy condition.

HANDY TO KNOW

WHERE warts trouble as they often do in the case of young people, the juice of the milkweed plant frequently applied will cure them. Or the old fashioned live-for-ever with the thick oily leaf used in the same manner is also efficacious; or a little baking soda moistened and applied each night, being left to dry on will cause their disappearance if continued.

* * *

If you get a cinder in your eye take a single whole flaxseed, and if left in the eye a short time will enmesh the cinder which may be removed with the seed.

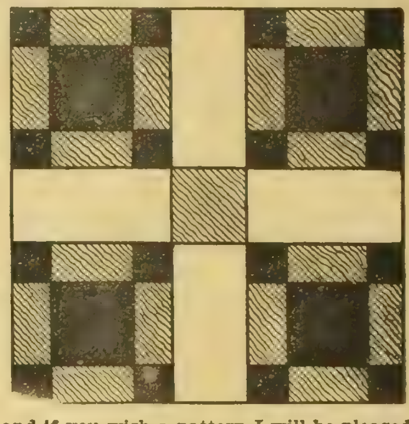
Personal Column

Wants Clothing for Ladies' Aid.—I am wondering if there are any readers that have articles of clothing that they do not use any more, also that have nice pieces that they do not want and pieces that would work up into quilt blocks. If there are any such ladies would they please donate them to the Bethel Ladies' Aid? We would appreciate them very much as we would like to furnish our church and it is slow work and we live in a new country and everybody is poor. These donations are to go towards our church and please send them to my address. Thanking you many times and asking God to bless you all I remain, Mrs. Jennie Foutch, Gladwin, R4, Michigan.

Help!—Will some reader of the M. B. F. send in a recipe for scalloped potatoes, to be printed in the M. B. F? Does any reader know of anything that can be burned in a soft coal range to prevent the soot from gathering and filling up the stove pipe and chimney?—A. K. G., Weidman, Michigan.

—Have you ever tried burning a dry cell battery in your range? I have a friend that uses nothing else and she has little trouble with soot. She takes old dry cell batteries that are worn out, and burns one in her range and one in her heater every week or so.—Mrs. A. T.

This beautiful quilt block design is the work of Mrs. J. VanAntwerp of Mayville, Michigan. The original block is made up in three colors, brown, green and white, and it is very pretty. I have this block and if you wish a pattern I will be pleased to loan it to you so that you may cut a pattern. I have several other designs to publish in the near future. Watch for them.



Canning Pickles.—Please let me know how to can pickles in wooden containers so they will be sour like those you buy and will keep indefinitely.—E. B., Beaverton, Michigan.

Here's Pickle Recipe.—In the issue of July 19th C. K. asks for a pickle recipe. Here is one we use and we are fond of the pickles and they keep fine. 1 cup of salt (barrel), ½ cup ground mustard, 1 gallon vinegar. Mix good. Add cucumbers as picked and stir every day, and for three days after last cucumbers are added. This makes two gallons of pickles. —I. F.

—if you are well bred!

More Finger Foods.—Apricots, nectarines and mandarins are finger foods. Bananas are stripped, laid on a plate and cut in mouthfuls. Fresh peaches, apples, pears (avocado and others), large plums and oranges should be quartered, the quarters peeled in turn, cut into portions and carried to the mouth by the fingers.

At the dinner-table (where fruit knife and fork are supplied with fruit) the orange may be speared with the fork, outer and inner skin cut away with the knife, and while the fruit is held on the fork, mouthfuls may be lopped from the heart and in the end carried to the mouth by the fingers.

Cherries, served with fruit shears, as a rule are eaten with the fingers; but watermelon (cut in wedges) is always served with fruit-knife and spoon.

Ginger in syrup, stuffed or stoned prunes, pineapples, and fresh figs call for a fork and spoon or fork and knife.

When any small fruits (including grapes, dried dates and raisins) are eaten, pits or seeds must never be spit out into a plate. The cupped hand should be unostentatiously raised to the mouth, the pits or seeds dropped into it close to the lips, and then noiselessly placed on the fruit-plate.

The rule for pits and seeds applies as well to terrapin and fish bones, which may be removed one at a time from the mouth by thumb and first finger.

Fruit stains are indelible, so a finger bowl should always be used before fingers wet with juice are wiped on a napkin. If the finger bowl is lacking, wait to wipe your fingers until they dry.

Menu for August 16th

Cream of Asparagus Soup
*Lamb Fricassee with Dumplings
Mine Jelly   Green Peas
Romaine Salad
Cheese
Toasted Crackers
Watermelon
Coffee

***Lamb Fricassee with Dumplings.**—Cup and dice enough cold lamb to make 1 quart. Season with salt and white pepper, put into greased baking dish and pour over following sauce: Blend 2 tablespoons fat with 2 tablespoons flour, and cook until brown. Now add 2 cups water and when it boils season with salt, pepper, onion juice to taste and pour over meat. Cover and bake in moderate oven 20 minutes.

To make dumplings, sift together 2 cups flour, ½ teaspoon salt, ¼ teaspoon sugar, and 2 teaspoons baking powder. Add 1 tablespoon fat and rub it with tips of fingers, then add sufficient milk to make soft dough. Roll out and cut into small biscuits. Place on top of lamb and bake in hot oven for 12 minutes. Serve hot.

EDUCATION AND THE BALLOT BOX

NO doubt a good many parents living on farms are still debating whether or not they will send the boys and girls to high schools, who, last spring, completed the courses offered in the small district schools. Less than one month remains in which to make this decision. Upon it rests the future welfare, not only of the boys and girls, but to a considerable extent that of the nation itself, for within a few years these boys and girls will be voters. By means of the ballot they will help decide upon the officers who shall administer the laws of our states and Nation and so upon the nature of the laws by which we shall be governed.

On the Fourth of July President Coolidge said in an address before the teachers of the United States, meeting in Washington, ". . . America has . . . placed the power of government squarely, securely, and entirely in the hands of the people. For all changes which they may desire, for all grievances which they may suffer, the ballot box furnishes a complete method and remedy. Into their hands has been committed complete jurisdiction and control over all the functions of government. . . . The body politic has little chance of choosing patriotic officials who can administer its financial affairs with wisdom and safety, unless there is a general diffusion of knowledge and information on elementary économic subjects sufficient to create and adequately to guide public opinion."

Practically every President from Washington to Coolidge has warned us that the improvement of American institutions depends upon the intelligence of the voters. Think of this mothers and fathers, living on the farms, before you decide not to give your boys and girls and the nation's future voters the advantages of a high school education.

RECIPES

Cheese Soup.—4 tablespoonfuls grated cheese, 3 quarts clear soup stock, 1½ cupfuls flour, 4 tablespoonfuls fat, 2 cupfuls cream, 2 eggs, salt, pepper, and paprika to taste, finely grated cheese. Put flour into double boiler, add gradually cream, fat, 4 tablespoonfuls of grated cheese and paprika to taste, stir over fire till a smooth paste. Break in eggs, mix well, cook two minutes longer and allow to cool. Roll into balls, when they are all formed, drop into boiling water and cook gently five minutes. Drain and put into soup tureen. Pour over boiling stock and serve with dish of finely grated cheese.

Green Peas a la Maitre d'Hotel.—4 tablespoonfuls fat, 1 quart peas, salt and pepper to taste, 1 tablespoonful lemon juice, 2 sprigs mint, 1 tablespoon chopped parsley, 1 teaspoonful sugar. Shell peas and throw into plenty boiling water containing teaspoonful salt, sugar, and mint; boil fast until tender, then drain. Mix lemon juice with fat, and parsley; stir this among peas, reheat them and serve at once.

Lunch Rolls.—1 yeast cake, 1¼ cupfuls milk, 2 tablespoonfuls sugar, 2 tablespoonfuls fat, 4 cupfuls flour, 1 egg, 1 teaspoonful salt. Scald and cool the milk, then add yeast and sugar. Now add fat and 2 cupfuls flour. Beat thoroughly, then add egg well beaten, remainder of flour and salt. Mix and turn out on floured board and knead lightly and thoroughly, using as little flour as possible. Place in greased bowl, cover and set aside in warm place to rise two hours. When light, form into small rounds, place one inch apart on greased pan. Allow to rise half an hour. Brush over with fat and bake in hot oven fifteen minutes. Sufficient for twenty rolls.

A Fruit Cookie Recipe that Some Farmers Wife May Like.—2 cups brown sugar, ½ cup of sour cream, 1 cup lard, 2 cups raisins, chopped fine, 1 cup walnut meats chopped, 1½ teaspoon soda dissolved in a little warm water, 3 eggs well beaten, 2 teaspoons lemon extract and enough flour to make a soft sponge not too much flour as it will make cookies dry and brisk, 3½ cups preferred.—Mrs. A. C.

Columbia Muffins.—3 tablespoonfuls of sugar, 3 tablespoonfuls fat, 1 egg, 1½ cupfuls milk, 1 teaspoonful salt, 3½ teaspoonfuls baking powder, 3½ cupfuls of sifted flour. Sift flour, salt, and baking powder together. Cream fat and sugar, add egg well beaten, then milk and flour mixture. Divide into greased and floured gem pans and bake twenty-five minutes in hot oven. Sufficient for twenty muffins.

The Runner's Bible

(Copyright by Houghton Mifflin Co.)

But they that wait upon the Lord shall renew their strength; they shall mount up with wings as eagles; they shall run and not be weary; and they shall walk and not faint. Isa. 40:31.

Fatigue is the result of a lack of understanding, as ignorance of the Truth, a punishment for not observing the law of the Spirit. If before you begin your labors you would "seek the Kingdom of God" you would find your way made plain, your work made easier and much of it done for you.

WOMEN'S EXCHANGE

If you have something to exchange, we will print it FREE under this heading providing: First—It appeals to women and is a bonifide exchanges, no cash involved. Second—It will go in three lines. Third—You are a paid-up subscriber to The Business Farmer and attach your address label from a recent issue to prove it. Exchange offers will be numbered and inserted in the order received as we have room.—MRS. ANNIE TAYLOR, Editor.

119.—Embroidered doilies for 10 in. blocks of bleached muslin with flowers appliqued on.—Mrs. Mae Mattinson, Turner, Michigan.

AIDS TO GOOD DRESSING

FASHION BOOK NOTICE

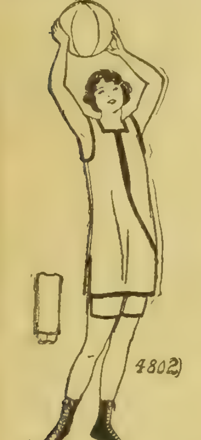
Send 10c in silver or stamps for our UP-TO-DATE FALL AND WINTER 1924-1925 BOOK OF FASHIONS, showing color plates, and containing 500 designs of Ladies', Misses' and Children's Patterns, a CONCISE and COMPREHENSIVE ARTICLE ON DRESSMAKING, ALSO SOME POINTS FOR THE NEEDLE (illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.

BE SURE AND SEND IN YOUR SIZE

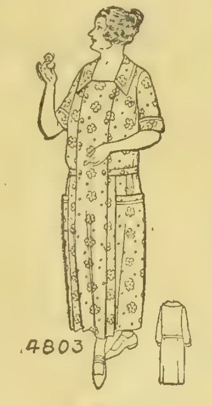
4814. A Stylish Youthful Frock.—Printed or embroidered voile, figured silk or linen would be good for this model. Organdie, linen or other plain material in contrats is nice for trimming. The Pattern is cut in 4 Sizes: 14, 16, 18 and 20 years. A 16 year size requires 3¼ yards of 40 inch material. The width of the dress at the foot is 1⅝ yard. For collar, vestee and facings of contrasting material ¾ yard 32 inches wide is required.

4815. A Popular Style.—This sleeveless dress is simple, and easy to develop. It may be of wash silk, pirnted voile, crepe or gingham. The guimpe may be of contrasting material, or may be overlaid with material to from a vest as illustrated. The Pattern is cut in 4 Sizes: 8, 10, 12 and 14 years. A 12 year size requires 3⅝ yards of 32 inch material The Guimpe of contrasting material requires 1⅛ yard 40 inches wide.

4801. A Pretty Draped Frock.—Figured foulard is here portrayed. Pipings in a plain color form a suitable finish. One could have this in crepe, pongee or in the new printed voiles now so popular. The Pattern is cut in 3 Sizes: 16, 18 and 20 years. A 16 year size requires 4⅜ yards of 40 inch material. The width of the dress at the foot is 1¼ yard.



4802



4803

4802. A Pretty Bathing Suit.—White alpaca with bands of black sateen is here shown. This style is also attractive for satin, crepe, jersey and taffeta. The Pattern is cut in 4 Sizes: Small 34-36, Medium 38-40, Large 42-44, Extra Large 46-48 inches bust measure. A Medium size requires 3⅝ yards of 36 inch material.

4797. A Comfortable Undergarment.—This model may be developed in cambric, nainsook, crepe, silk or washable satin. The fulness at the lower edges may be gathered in knicker style, or finished with a hem in straight line. The Pattern is cut in 4 Sizes: Small, Medium, Large and Extra Large. To make this style for a Medium size requires 1⅝ yard of 36 inch material.

4818. A Pleasing Dress Style for the Little Miss.—Cotton repp or linene would be good for this model. The collar, belt, sleeve facings and pocket flap could be of contrasting color. Gingham, ratine and pongee are also nice for dresses of this kind. The Pattern is cut in 4 Sizes: 4, 6, 8 and 10 years. A 6 year size requires 2¼ yards of 27 inch material.

4796. A Good Corset Substitute for Slender Figures.—This brassiere has good lines. It is comfortable. The closing may be effected at the side front or under arm seam. Jean, cambric, brocade, linen, mesh, or sateen are good materials for this style. The Pattern is cut in 4 Sizes: Medium for Ladies, and 16, 18 and 20 years for Miisses. A 16 year size requires ⅝ yard of 36 inch material.

4803. A Pleasing Morning Dress—This is a good model for women of mature figure. The closing is effected under the panel in front. Figured percale would be nice for this style. The Pattern is cut in 7 Sizes: 38, 40, 42, 44, 46, 48 and 50 inches bust measure. A 40 inch size requires 5¼ yards of 36 inch material. The width at the foot with plaits extended is 2⅜ yard.

Safety at the Crossing

PROTECTION of life at railroad crossings is a work that the New York Central Lines, through its Safety Bureau, has been aggressively engaged in since the coming of the automobile.

While the records show that only a small proportion of automobile accidents occur at railroad crossings, loss of life at crossings is a cause of deep concern to railroad managements.

When it is realized that 70% of crossing accidents occur in daylight, that 63% are in the open country where approaching trains can easily be seen, and that the majority are at crossings with which drivers are very familiar—it is plain that the number of crossing accidents can be greatly reduced *if automobile drivers will not attempt to cross the tracks until they are sure that it is absolutely safe to cross.*

KEEP WORKING

Though your goal seems for away
Keep working.
Always keep your spirits gay
Keep working.
If the sky's not always blue
Don't do what you'd like to do
For it is a trial of you
Keep working.

If you work, the sky will clear
Keep working
For it proves you have no fear.
Keep working
And always when the sky looks black
Again the test is on your track
So be prepared for the attack
Keep working.

—Orville H. Trueblood.

DEAR girls and boys: — How many of you like to perform tricks of magic? I am going to tell you how to do a very good trick but do not attempt to repeat your performance if you do not wish them to know how it is done.

This trick is knocking a tumbler through a table. You sit on a chair behind a table, keeping your audience in front of you. Place an ordinary tumbler upside down on the table. Cover the tumbler with a newspaper and press the paper down around the glass so it takes the form of the tumbler. Hold the paper to the edge of the table, let the tumbler drop into your lap, quickly returning the paper to the center of the table. The stiffness of the paper will preserve the form of the tumbler. Hold the paper form with one hand and with the other strike it a heavy blow. At the same instant let the tumbler roll easily from your lap onto the floor. It looks like you have positively knocked the tumbler through the table. Smooth out the paper before anyone can examine it.

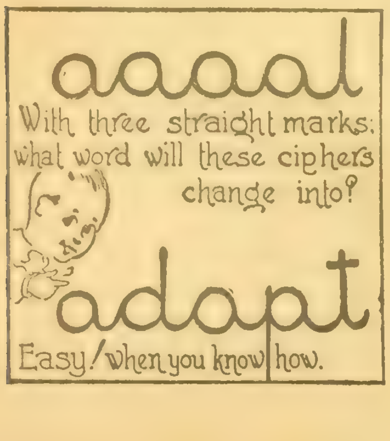
But remember, once is enough for this trick, that is if you wish to keep it a secret.—UNCLE NED.

OUR GIRLS AND BOYS

Dear Uncle Ned:—I was just reading the Children's Hour, and I thought I would try my luck at writing. I have never written to you before. I see all the cousins are describing themselves so I will too. I have dark brown bobbed hair, blue eyes, am 5 feet short, and weigh 100 pounds. I am a store-keeper's girl, 13 years old. I have one brother and one sister. I hope Mr. Waste Basket does not get my letter. I hope some of the cousins will write to me. Your niece,—Evelyn E. Crosby, R4, Merrill, Mich.

Dear Uncle Ned:—May I join your merry circle? I have been a silent reader of the Children's Hour for a long time. I will describe myself: I am five feet one inch high, weigh 114 pounds and have dark blue eyes and brown hair and fair complexion. My birthday is the 5th day of November. I live on a farm, 83 acres, with my parents, and one brother. I am 12 years old and in the 7th grade. For pets I have 1 dog and 1 cat. We have 3 head of horses, 7 cows, 4 calves and 75 chickens. One of the riddles Agnes Posey, Marine City put in the paper was: What is the last hair on a dog's tail called? Answer, dogs hair. Now Agnes I am looking for a letter from you, and Agnes you send me your picture too. Now for a riddle: What side of a horse has the most hair on? Answer, Outside. Will some of the boys and girls please write to me? I will gladly send a letter to them. I hope Mr. Waste Basket does not get his hands on me. Your niece,—Gertrude Angel, Standish, Mich., R. 1.

Dear Uncle Ned:—May I join your merry circle? I have written before but Mr. Waste Basket got my letter. This time I hope Uncle Ned gets it. I am a farmer's girl eleven years old and am four feet and six inches tall. I am in the sixth grade at school and we have already had our picnic. I have two sisters and two brothers. My sisters are fifteen and thirteen years old, my brothers are six and two years old. There were some violets in our woods and in one place there were so many you could not step without stepping on them. I got a pretty bouquet. As my letter is getting long I will close hoping some of the boys and girls will write to me. I will answer all letters received. Your niece,—Louise Frederickson, R1, Elberta, Michigan.



Dear Uncle Ned:—I was just reading the Children's Hour and thought that I would write a letter too. I hardly ever see any letters from Ithaca. I live on a farm (80 acres) north east of Ithaca. I am five feet four inches tall and I am fifteen years old. We have two canary birds which I enjoy very much. I have four brothers. Their names are Wayne, Clark, Theodore, and Ezrar. We have an Overland car and I drive it. We have a dog and his name is Mack. I go to town school and I will be in the eighth grade next year. I hope to get lots of letters from the girls and boys. I will close as it is late. Your niece,—Margaret Deveraux, Ithaca, Michigan.

Dear Uncle Ned:—I have just been reading the M. B. F. and the Children's Hour. Say Uncle Ned, I think that Ilene Wingard and Helen Goodrow has some good ideas, don't you? Well I believe I had better describe myself. I am real short for my age but I weigh 103 pounds. Can anyone guess my age? I have blue eyes, dark hair (and it is not bobbed). Well my letter is getting a little long so will close hoping that you have moved the waste paper basket a little way off. I will answer any letters from those who try to guess my age. Your long-haired niece,—Kathryn Seaton, R. 3, Fenton, Michigan.

Oh you dear old Uncle Ned:—How glad I was today to know you were still among the living. Do you remember me? You surely do. It has only been two or three years (but it seems ages) since I was a friend among the cousins. I made many dear chums during my stay. I think I received letters from nearly 50 boys and girls.

If you remember when I last wrote my daddy was very sick and was in the hospital several weeks during which time I was away from home. Many letters came to me during that time and when I came home papa was so very sick yet—well it just seemed some way after papa's trouble things changed—I didn't answer all of my big stack of letters, partly for lack of postage and stationery and partly because I was too sad to sit and write I guess, then our M. B. F. expired and we failed to renew and I got completely lost from you. But we have again subscribed for our good old friend. We got our first copy today and I was real surprised to see our page still lived, as a friend had told me the Children's Hour had been taken out.

Although it has only been two or three years since you heard from me (as I said before) I have changed quite a bit. I am now 16 years old and have changed my long curls for "bob" but I am still the same old "farmer John" helping daddy out of doors, ride horse-back, hoe—yes "Whistle and hoe, sing as I go". I am as busy as a bee all week but I go to church every Sunday. Our minister is just the loveliest old gentleman you ever saw Uncle Ned. We had a Sunday school picnic at the beach on the 4th. We sure all had a lovely day. I won second prize in the girls' foot race.

My! Did I hear you say you did not remember me? Why don't you remember Eathel Fay Sharp that sent you the handmade string to wear around your neck? The "kid" that won the flashlight for the best letter written about the fair they attended? I knew you just couldn't forget her. Ha! Ha!

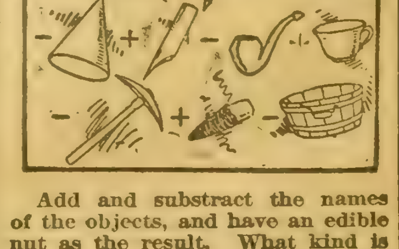
I will send you a picture of myself taken the day I graduated as soon as they are finished. Guess I must close now. Am glad I found you and hope we will meet again. Your want-to-be niece,—Eathel Fay Sharp, R3, Akron, Michigan.
—Well, well—and a couple more wells, if here isn't Eathel back. It's about time you came back young lady and I don't want you to neglect writing for such a long period again. If you do—well. And you, an old friend, even thought the Childrens' Hour had been taken out of M. B. F. Why the very idea. Tell your friend that as long as M. B. F. is printed the Children's Hour will be a part of it. Come again, Eathel, and don't forget to send that picture.

Dear Uncle Ned:—Knock, knock. Can I come in? I hope so as I have never before. Whoa back, hold on! I had better describe myself hadn't I? Well I am 12 years old and am in the seventh grade at school. Do you think that is very good? My hair is quite dark and of course it is bobbed. I wouldn't have long hair, would you Uncle Ned? Say Uncle Ned why couldn't we have a drawing contest on some things? I think it would be fun. Well I think Mr. Waste Basket has got his eye on this letter. Your want-to-be niece,—Miss Belma Hogan, Muir, Mich., in care of Hogan Bros.
—No I would not have long hair, in fact I believe long hair would not be very becoming to me.

Dear Uncle Ned:—As you see from my address I have moved since you last heard from me. I moved ten miles, on the 17th of January, 1924. Some cold day to move, too, especially a long one. We did it in a sleigh and it did not seem very long to me. Well Uncle Ned, I am sending you another poem which I hope you will see fit to publish. Not very long ago, I saw a poem at the head of our page and it looked so nice I decided to try my luck again. Well, as I don't want to take up too much space, I guess I will close for the present. Goodbye, Uncle Ned and all the cousins. From your poetic nephew—Orville H. Trueblood, R2, Muir, Michigan.
—Your poem is very good, Orville, and I am publishing it at the head of our page. Send in more of your poems.

Dear Uncle Ned:—Oh! now don't say you don't want me to come in because I come so often. If you let me in now I won't come again for a long while. Cousins don't you think that would be all right? I think Billy Frank is 17. Am I right? What did all the cousins do on the 4th? I had an awful good time. We went to a lake, it is a resort. Went in bathing in the forenoon and danced in the afternoon and there were fireworks at night. I will close with a riddle. What is it goes all over the fields and through the woods and comes to the doorstep yet never comes in? I would like all the cousins to write to me, girls and boys, old and young. Your loving niece—Beatrice Campbell, R. No. 5, Box 39, Hesperia, Michigan.
—Sure I will let you in. There is not limit to the number of letters you may write to me.

Dear Uncle Ned:—May I join your merry circle? I have been a reader of the M. B. F. for a long time. I live on a farm of 90 acres. We have 3 horses, 13 head of cattle, 18 head of sheep and 200 chickens. For pets we have 8 cats and a collie dog named "Jiggs". Jiggs is a regular playfellow. If the cows are in sight he will go after them and does many other things. He likes to play ball and if he catches the ball sometimes runs away with it and sometimes takes it to someone not playing. I think I had better describe myself or you will be wondering what kind of a "chicken" I am. Ha! Ha! I am 5 feet 3 inches tall, weigh 125 pounds, have medium brown bobbed hair and grey blue eyes. I will be a junior in Hillsdale high school next year. I wear glasses which are a lot of bother when I'd like some fun but cannot see very good without them. I am a Girl Reserve, our club is called "Honembro", it was organized last fall—four district schools going together, we have lots of fun. Oh yes, I will let you guess my age and birthday. My age is between 15 and 20 and my birthday is between July 2nd and 10th. Those who guess my birthday and age right or nearly right will receive a letter from me. I like English, history and domestic science. I have enrolled in English XI, modern history, economics, music and cooking. I have had 2 years of sewing. I like camping and horseback riding best of all sports. Well I must close for this time as the catchall waste paper basket will surely catch this. I would like to hear from some of the boys and girls between the ages of 15 and 20. From a want-to-be niece—Ruth Brown, R. 1, Box 71, Hillsdale, Michigan.
—I enjoyed all of my studies when I went to school and especially reading. As for sports I like to skate, swim and play ball.



Add and substract the names of the objects, and have an edible nut as the result. What kind is it?

Answer to last puzzle: OCELOT, MARMOT.

Why the Ostrich Hides Head

"MY dear," said Father Ostrich to the tallest and finest of his four wives, "it is your turn to watch our twenty new, white eggs."

And Father Ostrich, who was very tall, craned his neck and looked proudly toward the nest of eggs which were snuggled away in a pit in the warm sand.

The eggs were as large as cocoanuts, and the shells pure white and very thick. About the thickness of a china cup. And, of course, Father Ostrich was very proud of them. For soon tiny, fuzzy-uzzy baby ostriches would peep through, and they would grow bigger and bigger and some day their feathers would be sold for a great deal of money.

Mother Ostrich waved a fond farewell to Father Ostrich, declaring she would take care of the beautiful, white eggs. But no sooner had Father Ostrich left, than Mother Ostrich happened to think of a lovely little spring of water a short distance away. Now in the Sahara desert where the Ostrich family lived, there are very, very few springs of water. And mother Ostrich dearly loved a cool bath, and a fresh drink.

She looked at the twenty new eggs, which were pure white with very thick shells.

"Surely nothing will harm them", thought Mother Ostrich, thinking of the bath she loved so well and the cool, fresh drink. And slowly, almost without realizing what she was doing Mother Ostrich paddled over the ocean of sand toward the cool spring.

The more she thought of the cool spring and the fresh drink, the faster went her long, strong legs. Soon she was going faster than a horse could trot. Her little blue bonnet bounced as she ran.

True, my dears, she was a little worried about those twenty white eggs, from which twenty little fuzzy-uzzy heads would soon peep.

"Oh well, I am sure nothing will harm them", she reasoned with herself. "And perhaps one of the other ostriches will return and guard them." You see, Mr. Ostrich always has four or five wives.

Well, while the neglectful Mother Ostrich was running very fast toward the cooling oasis which was very far away from her home, Mr. Jackall was hunting, hunting for a feast of ostrich eggs. Just think of that!

Mr. Jackall was becoming very much discouraged. For you see, wild ostriches have become very, very scarce. Of course, my dears, many tame ones are raised on ostrich farms.

But there, I must tell you about that horrid old Mr. Jackall. Because of course you are wondering about those twenty white eggs.

About the time Mr. Jackall had decided to give up the search he happened to spy those beautiful, pure white eggs, which Father Ostrich had guarded every night so proudly for such a long, long time. And which Mother Ostrich had neglected.

"Oh my, oh me!" snapped Mr. Jackall, putting one lean paw over his empty stomach. "Such a fine meal!" Um-m-m-m!"

And, my dears, before you could say "Jack Robinson" that horrid old Mr. Jackall had gobbled up those twenty beautiful, white eggs which were as big as cocoanuts.

Then very, very quickly and quietly he stole away.

At just this time the Mother Ostrich was hurrying, hurrying home. It is true she was very much worried, and why should she not be? She had shirked her duty!

As soon as she reached the nest which was in a pit in the warm sand, she started running wildly around in a circle, for, goodness gracious me! every one of those snowy white eggs were gone! Even the few eggs which had been laid outside the nest for food for the young fuzzy-uzzy ostriches was gone. Just think of that!

Mother Ostrich's heart sank. And there came Father Ostrich!

Mother Ostrich was so ashamed. What would she do? Suddenly, in desperation, she dove her long neck, little blue bonnet and all, into the sand, thinking that Father Ostrich would not see her.

And whether he did or not, my dears, you may guess. And what poor, sad Father Ostrich said to Mother Ostrich you may also guess. For, of course, Mother Ostrich could not expect mercy when she had neglected her duty.

And ever since the Ostrich family has had the sly little trick of burying their heads in the sand, when they do not wish to be seen.—Helen Gregg Green.

Michigan Crops Look Promising!

Much Wheat Threshed Direct From Field—Less Oats Barley, Rye, Buckwert, Potatoes, Hay, but more Beans and Beets Forecasted.

Too much rain in some sections.

CORN

Present conditions point to another good crop in Michigan, the present condition of 90 percent representing a production of 62,213,000 bushels, the fifth crop in succession to exceed 60,000,000 bushels. On good lands, the stands are excellent, the growth is large, and the stalks are earing well. Dry weather has caused some firing in small areas but no excessive damage is reported.

WHEAT

Threshing is well under way, much grain being threshed direct from the field because of extreme labor shortage. Returns to date indicate an average yield of 17.0 bushels per acre or a total winter wheat crop of 16,456,000 bushels. The average yield in Michigan is 16.7 bushels per acre. The quality of the grain is excellent and is rated at 90 per cent, two per cent better than last year and the ten-year average.

The condition of spring wheat is similar to that of other spring sown grains, the early part of the season being too dry. The present outlook is 80 per cent, representing a production of 125.000 bushels.

OATS

Oats continued to improve up to the time of cutting, and on heavy soils is a generally good crop except in localities where drought has prevailed. On the rolling and light lands the straw is very short but a good yield in proportion to the quantity of straw is expected. The probable production is estimated to be 48,043,000 bushels, or slightly less than that of last year. The protion of last year's crop still remaining on farms is reported as 7 per cent.

BARLEY

Beneficial rains occurred in some of the best counties, and the estimate is increased to 3,483,000 bushels which is about the same as that of last year. The condition is 82 per cent or three per cent below the ten-year average.

RYE

Threshing is in progress and early returns indicate an average yield of 14.0 bushels per acre. The average for the last ten years is 14.3 bushels. The production is estimated to be 7,252,000 bushels the least since 1917. The quality of the grain is generally good, averaging 92 per cent.

BUCKWHEAT

The preliminary inquiry regarding the acreage sown this year has been completed and resulted in an estimate of 60,000 acres as compared with 62,000 last year. There was a considerable increase in some sections, but the general shortage of labor and heavy farm abandonment in many of the principal counties caused the smaller total. The crop is generally doing well and shows a condition of 87 per cent or three per cent above the ten-year average. This represents a production of 887,000 bushels.

POTATOES

The condition of the potato crop is slightly above the average being 83 per cent as compared with 87 per cent last month and last year. Some of the seed was damaged by extreme heat following planting causing poor stands. Dry weather has also caused a spindling growth in some localities, but there are many fields in excellent condition. The present outlook is for a crop of 29,297,000 bushels on the 318,000 acres planted. Last year's final estimate was 37,842,000 bushels. The rainfall during the next four or five weeks will be the principal factor in establishing the actual yield.

HAY

Clover and timothy hay was a light crop except in a few eastern and northern counties where ample rainfall produced a good yield. Alfalfa yielded well in most section although not quite up to the average. The total production of tame hay is estimated at 3,408,000 tons or a little over one million tons less than last year. Considerable hay was damaged by rains in eastern and northeastern counties.

FIELD BEANS

The crop is exceedingly good in nearly all section. There has been a little local damage by dry weather, and there are some complaints of disease and failure to set pods. This has lowered the average condition two points from last month which was less than the average decline in July, hence the estimated production is slightly greater than that of July 1 being 6,825,000 bushels.

SUGAR BEETS

Fields present a varying condition, ranging from stands of 50 per cent or less up to perfect stands. Moisture has been insufficient in some sections but on the whole the growth is satisfactory and the condition is 85 per cent, one per cent higher than last month.

TRUCK CROPS

Tomatoes have maintained the same condition as one month ago, 86 per cent. Cabbage shows a decline of one per cent to 85 per cent. Early varieties are being harvested and marketed. Onions now show a condition of 87 per cent, having improved five cent as a result of rains in the main commercial districts.

FRUIT

The estimate on the agricultural crop of apples is increased to 12,045,000 bushels as compared with a total production last year of 11,850,000 bushels.

The peach crop is maintaining its earlier favorable prospect, the present indications pointing to a crop of 1, 172,000 bushels as compared with a production of 1, 440, 000 bushels last year. The early varieties are being harvested and marketed.

CROP REPORTS BY COUNTIES

CALHOUN—Crops very good except corn which will be as good as ever if frost will hold off till Oct. 1st.—B. B. C., County Agent.

MUSKEGON—Corn about 4 weeks behind calendar but improving. Potatoes are good, also oats and wheat. Small fruits, good yields. Apples fair set.

JACKSON—Oat crop very good, corn way behind, abundance of hay, new seedings generally good and some wheat being threshed with fair yields reported.—R. E. Decker, County Agent.

IONIA—Wheat in shock being quite badly damaged by too much rain-yield heavy. Corn very short and poor stand. Hay fair crop-badly damaged in making. Beans very good. Oats unusually heavy crops-down badly.—R. L. Helm, County Agent.

CRAWFORD—Abundant and timely rains making corn, oats and potatoes splendidly; also bringing on good second cutting of alfalfa and clover, as well as making it safe to sow clover. Crops got a late start this spring. Will be little or no hard corn in this county.—R. D. Bailey, County Agent.

MANISTEE—Cherries, cracked and brown rot developed due to excessive rain. Crop 60 per cent. Berries heavy crop—bad rain damage. Potatoes, cucumbers, beans—good prospect. Grain-weather interfers with; heaviest prospective yield good. Corn-very late-poor prospect.—H. M. Vaughn. County Agent.

VAN BUREN—Corn poor stand, backward, alfalfa heavy first cutting, second cutting good but poor weather to get it up. Grapes fair crop, quality promises good at present. Apples light crop, lots of scab. Wheat fair crop, poor weather for harvesting. Peaches but very few around S. Haven, fair crop.—W. C. Eckard, County Agent.

OTSEGO—Corn very backward; oats normal crop; rye about 5 year average; potatoes showing fairly well for this date. Pasture continues good on account abundant rains; hay exceeding June promise and feed supply; excellent corn seem assured, alfalfa again stepping out in front as a champion producer of quantity hay. Excellent year for seedings.—A. C. Lytle.

NEWAYGO—Corn three weeks late. Wheat 75 per cent damage from excessive rains during harvest, growing in shock. Beans suffering from too much rain. Potatoes fair but above cause damaging crop. Oats getting over ripe and storms have caused them to lodge badly. Apples fair average with light crop of winter varieties.—Clair Taylor, County Agent.

OGEMAW—Crops appear the best all around that they have appeared at this time of year for several years. Hay crop has been at least normal, potatoes never looked better, oats have overcome their late start, wheat is the best in several years, rye is a normal crop, and corn has gained much with a late start. Corn is perhaps the one crop that is below normal for this time of year.—W. C. McCarthy, County Agent.

TUSCOLA—Wheat a fine yield but much sprouting in shock. Oats average down very much. Barley good if wet weather does not continue. Beans—rains did great deal of damage, many fields look as if they will not be worth harvesting. Potatoes late blight starting, potatoes set heavy. Corn very uneven much will not mature. Alfalfa good but bad curing weather. Rye good but some sprouting. Beets fair to good. Clover as with alfalfa.—County Agent.

ST. CLAIR—The incessant rains of the past two weeks have been very detrimental to the crops being harvested. Much hay is still uncut, also many acres of wheat. Wheat in the shock is beginning to sprout. Oats are down badly although will undoubtedly fill fairly well on account of the moisture in the soil. Corn has picked up in the past three weeks. Corn and beans very weedy on the average. New seeding exceptionally good, although much mildew on the clover. C. M. Kidman, County Agent.

OTTAWA—Wheat was best looking crop ever, but continued rains have sprouted considerable. Early potatoes best crop ever raised in county. Late potatoes not doing so well, too wet for them. Corn very backward altho some on light soil is coming satisfactoraly. Oats ripe and being cut. Good crop. New seedings of alfalfa and clover are fine. This is also an exceptionally good season for development of weeds. Farmers felt fine about conditions of crops, but unless warm clean weather prevails they will feel pretty blue.—C. P. Milhan, County Agent.

Hudson's—Detroit

Erecting a New
15-Story Building

The New 15 Story Building
(Now Under Construction)

This new 15 story building now under construction, added to our other buildings, will give Detroit and Michigan one of the largest and finest retail establishments in America.

It is concrete evidence of our faith in the future of Detroit and Michigan—and of our determination to keep pace with their remarkable growth.

We are building "A Greater Store for Better Service for a Greater Detroit and a Greater Michigan."

We Reach an Important Milestone in our History This Year and Will Celebrate with our 43rd Anniversary Sale

Beginning Tuesday, September 2, this great annual sale will offer you the opportunity to supply your Fall and Winter needs in merchandise of good quality for home and family at very remarkable savings.

The Hudson Anniversary Sale Starts During State Fair

Visit the fair (August 30 to September 6). Do your buying for Fall and Winter at the same time at the Anniversary Sale, (beginning September 2).

You will find every convenience of this great store at your service while in the city and you are cordially invited to make full use of it.

Further Details of the Anniversary Sale will appear in the August 30th issue of this paper and in the Detroit Daily Newspapers.

Harvest Beets the Easy Way

Lift them while you ride, do the work quickly and with less damage to the roots; make it easy for the hired help to get all of them by using the

JOHN DEERE
Riding Beet Lifter

This machine loosens the soil and raises the beets slightly so they can be readily pulled. They are not jerked out and strewn on the ground where they will lose weight by being exposed to rain and frost and the sun's rays. Remember, beets are sold by weight.

The blades do not injure roots. Foot dodge enables you to follow uneven rows. Light draft; only two horses needed under ordinary conditions.

Write for FREE BOOKLET.

DAIRY and LIVESTOCK

HARNESSING FENCE JUMPERS

MANY contrivances have been devised to prevent horses from jumping fences. Yokes of all descriptions have been constructed with the central thought of punishing the animal when he approached the fence, with the result that horses are often injured by such contrivances. A contrivance free from such dangers, and equally, if not more efficient, is made as follows: Procure a surcingle with a ring at the bottom, a short piece of rope, and two leg-straps provided with rings. Place the surcingle on the horse and buckle the straps about the forelegs just above the knees. Tie one end of the rope in the ring at the back of the left knee, then pass the free end up through the ring at the bottom of the surcingle, then down, drawn medium tight, and tie in the ring at the back of the right knee. This will permit the horse to walk naturally, lie down, get up, and in fact, do almost anything except run or jump, which it most effectively prevents. The principal advantages are that there is no risk attached to its use and the horse's head and neck are perfectly free.—Nor'West Farmer.

STATE FAIRS WILL AWARD HOLSTEIN PRIZES

THE two leading fairs to be held in Michigan this year will receive special prizes from The Holstein-Friesian Association of America in addition to those awarded by the fair associations. The Michigan State Fair, Detroit, August 29 to September 7, will receive $718.50 and the West Michigan State Fair, Grand Rapids, September 15 to 19, $107.40.

To be eligible for receiving this money the following requirements prevail:

1. All animals must be registered before exhibition and must stand on the records of The Holstein-Friesian Association of America in the name of the exhibitor.
2. The awards must be placed by one of the official judges of the Association who will award no prize except where the animals are strictly first-class.
3. The judge or the superintendent of dairy cattle shall examine the certificates of registry and transfer to see that the provisions of the first requirement have been complied with.
4. The Association's share of the prizes will be paid direct from the Secretary's office and not by the fair management.
5. All animals over six months old must have been tested for tuberculosis within six months by a duly accredited Federal or State veterinarian. The certificate showing freedom from this disease must be exhibited to the fair authorities. Grounds and barns must be disinfected in accordance with Federal or State requirements.

Special prizes to boys and girls in calf club work will also be awarded at state fairs and national dairy shows by the national Holstein Association. The amount offered at each show is determined by the number of Holstein calf club members enrolled by the state college boys and girls club leader.

DETROIT CREAMERY OWNS NEW HOLSTEIN CHAMPION

MICHIGAN'S new Holstein champion cow for ten months' production as a junior three-year-old Traverse Duchess Korndyke, owned by the Detroit Creamery Company at Mt. Clemens. Her record is 20,456.4 pounds milk containing 671.43 pounds butterfat, equivalent to 839.2 pounds butter, according to the advanced registry department of The Holstein-Friesian Association of America.

As a consequence of this record she displaces the former state champion in her class, Flint Maple Crest Crown De Kol, who in the herd of D. D. Aitken of Flint, made a record of 17,849.1 pounds milk and 743.5 pounds butter.

GOAT TO PROTECT SHEEP FROM DOGS

Could you tell if goats were used as a protection in large flocks of sheep against dogs? If so is it the buck or ewe goats that are the best? I am a reader of your paper and have a large flock of sheep and would like to protect them against dogs.—E. J. F., Lambs, Michigan.

THE goat is not as timid an animal as a sheep and consequently not as easily frightened and will in many cases turn to fight a dog rather than fleeing from it.

Sheep on the other hand are very timid and easily frightened, and once they are running it is of course sport for the dog to catch them.

Billy goats are, therefore, a slight measure of protection against dogs, as the sheep are not nearly as apt to be stampeded and it is extremely doubtful if a dog would commence a sheep killing career in a flock where there were several goats. On the other hand, a dog which was a real sheep killer, or especially savage, would not be in the least deterred by goats.—Geo. A. Brown, Professor of Animal Husbandry, M. A. C.

HIGH COWS IN TESTING WORK IN MICHIGAN DURING JUNE

The following tables show the 5 high cows in the respective age classes in the Michigan Cow Testing Associations reporting for the month of June. These are the highest butterfat producers in the test work in the seventy-eight associations reporting. There were eighty-nine associations in operation.

FOR SALE; Large Poland China, Either Sex. Hampshire sheep. One year old Shetland Pony. H. W. Garman & Sons, Route 3, Mendon, Mich.

THE FUTURE IN DAIRYING

THE farmer has been feeling competition most keenly since the war. This is due to many causes: poor prices for farm products compared with prices for other commodities, high labor costs, and a higher standard of living on the part of the farmer. How much we can change these conditions thru legislation is a question that will not be discussed here.

The American dairy farmer is protected by a tariff which in round figures is 32 cents on 100 pounds of milk or its products. This does not prevent the importation of dairy products from eight or ten countries but consumption has taken it all and prices are still pretty good.

In my opinion the time is coming when we will have a surplus of dairy products and turn from an importing to an exporting country. This will mean a lower price which we must be prepared to meet. The principal expense in dairy production is the cost of feeding the cows, and we are fortunate in being able to compete with any country on this score. We who live in the land of clover, alfalfa and corn are favored and should be able to compete with any state or country. If we have to go out of the dairy business because we cannot compete, then I say we ought to quit, for it shows we are lame ducks on the essential economic factors of dairying.

Keep in mind there are a lot of states doing great work in the dairy business, and are increasing their output at a rapid rate, the government figures show that the state of Michigan has doubled her output of butter during the past seven years; Minnesota and Wisconsin have increased from 40 to 50 per cent; California, Ohio, and Indiana have shown a marked increase. The Dakotas and Nebraska are also increasing rapidly. Idaho and Montana are putting on dairy campaigns, and Nebraska is preparing to double her dairy business in the next five years. The southern states are encouraging dairying, and Kentucky has a Better Sires—Better Breeding campaign, which beyond question will result in a big increase. The dairy farmer has prospered and has come through this agricultural depression with flying colors. Dairy districts are not complaining of hard times. The country banker will tell you in short order that his patrons who milk cows have good credit in his bank.

We can stand over-production providing we are producing with economy. States keeping cows that produce from 100 to 150 pounds of butterfat cannot compete with states keeping cows that produce 200 or 250 pounds per cow. Neither farmers compete who feed inefficiently, who ignore the economic value of the silo or the value and use of legume hay.

While we are building our dairy industry let us understand the importance of laying the foundation on a substantial basis so we can turn from an importing to an exporting country without suffering a loss.—A. L. Haecker.

TESTING WORK COMING ALONG FINE

FOR many years Huron county has been known as the center for excellent beef cattle. A gradual change has occured and the nearness of large cities has necessitated the using of dairy cows in place of the beef cows. In June, 1923, work was started in Huron county to put these dairy cows on a better paying basis. Twenty-six dairymen went together and organized what was known as the Huron-Ubly Cow Testing Association. In June Otto Vestergaard cow tester reported that the average production for the 229 cows owned by these 26 dairymen averaged 267 pounds fat and 7788 pounds milk. One of the outstanding herds was owned by Mr. Donald Gordon. His seven cows were high in both milk and butter fat, producing 11,313 pounds milk and 420.3 pounds fat. Mr. Gordon's cow Diana, a grade Holstein nine years old, made 14,418 pounds milk and 550.1 pounds fat, highest cow in milk and butter fat production in the association.

Other herds that did well were owned by Ernest Hagen, Chris Krug, Frank Bensinger and Howard Nugent. That there is still plenty of chance for further improvement is evident in a summary of the four poorest herds in butter fat production which averaged 196.6 pounds butter fat and 5,629 pounds milk. The four highest herds averaged 365.9 pounds fat and 10,380.5 pounds milk. Sixteen cows made better than 365 pounds fat for the association year. The four poorest cows in the association averaged 3,948 pounds milk and 144.9 pounds fat. Not more cows but better cows are needed.—A. C. B., Dairy Ext., M. A. C.

MONROE FARMERS CONTINUE COW TESTING WORK

LYNN DEXTER, tester in the Monroe Association, reports that George Ihrig & Son had high herd in butter fat and milk production in the Monroe C. T. A. Ihrig & Son's nine purebred Holstein cows averaged 11,524 pounds milk and 357.1 pounds fat.

Guy Doty had high cow in milk and butter fat production. His seven year old purebred Holstein cow Flossie made 15,756 pounds milk and 532.6 pounds fat. Three hundred fifteen cows averaged 232 pounds butter fat and 6,590 pounds milk. The four poorest herds averaged 162 pounds fat and 4,940 pounds milk. Twenty-four cows made better than 365 pounds fat.

All members in this Association are using purebred sires. Mr. Dexter, the tester, reports that members without silos had a higher feed cost than members who used silos. The Monroe Association is carrying on the work and Mr. Dexter is continuing the testing.—A. C. B., Dairy Ext., M. A. C.

FLY REPELLANT

Can you give us a recipe for a spray mixture as a fly repellant on stock?—J. N., East Jordan, Mich.

WE send you two formulae for fly repellants which we find pretty fairly satisfactory: 12 oz. oil of tar, 12 oz. turpentine, 12 oz. crude carbolic acid, 10 or 15 cents worth of tannin. Make up to 5 gallons with kerosene. Apply lightly with atomizer.

Another formula: Coal oil, lard, carbolineum. Mix equal parts.—B. H. Pettit, Professor of Entomology, M. A. C.

VETERINARY DEPARTMENT

ONE QUARTER OF UDDER HARDENS

"I am writing to ask advice about one of my cows. About once a month one quarter of her udder will swell up hard and I will be unable to get but very little milk and then the next milking that quarter will soften up and I will milk out a lot of ropy milk and then that quarter will be all right. Sometimes it will occur twice in the quarter then in some other quarter. Now this is a good cow and I would like to cure her. Is this a sign of T. B.?—F. B. T., Midland, Michigan.

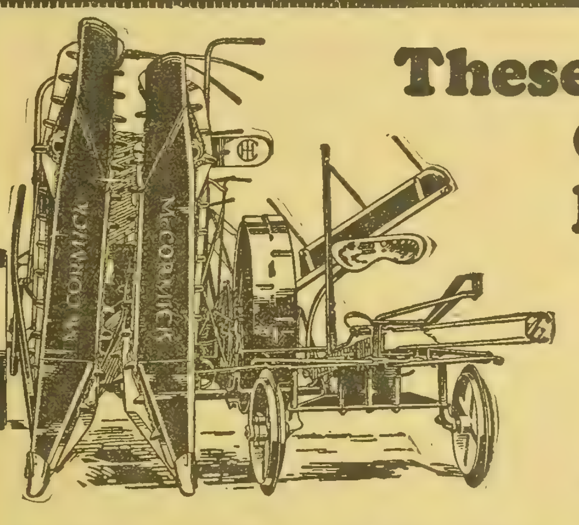
THE symptoms would indicate that your cow is suffering from mastitis. The cause of mastitis is infection. The infection may gain entrance into the udder through the teat opening or through the blood stream, more often the former.

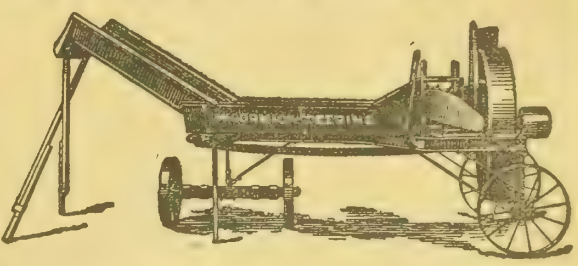
The only way to find out if your cow has tuberculosis is to have the tuberculin test applied. Better have your local veterinarian examine your cow. He can prescribe the necessary treatment for mastitis, and, if he thinks it advisable, you can have him apply the tuberculin test.—John P. Hutton, Assoc. Prof. of Surg. & Med., M. A. C.

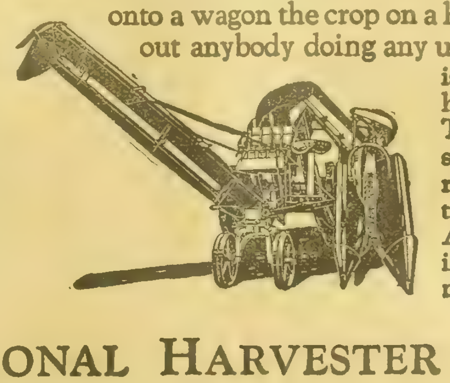
COW IS ALL RIGHT

Since my cow has been let out on grass her bowels are very loose and keeps very dirty. Can I do anything? If I salt her she is worse.—I. H., Edmore, Michigan.

IT is not at all unusual for a cows bowels to be quite loose when she is on good pasture. I think in all probability it is a perfectly physiological condition with the cow.—John P. Hutton, Assoc. Prof. of Surg. and Med., M. A. C.







These Machines Save Corn, Time, Labor, Money

McCormick and Deering Corn Binders

FOR years these binders have made fast work of the corn harvest. They do the hand work of five to seven men, and at the same time they do the cleanest kind of job. They pick up tangled and down corn. They can be adjusted for tall and short corn and they make easily handled bundles.

Both McCormick and Deering Corn Binders have been popular with owners for many years but they are of different design. The McCormick binds the bundles while they are in the upright position, and the Deering ties them as they lie flat. Both binders have roller bearings. Both have channel steel frames, securely bolted and riveted together. Sensible construction for avoiding field difficulties. Can be equipped to load bundles onto a wagon. Be ready for corn harvest. Ask the McCormick-Deering dealer about these binders and any of the modern corn machines mentioned here, or write us direct for complete catalog.

McCormick-Deering Ensilage Cutters

FILL your silo easily, economically, and at just the right time with a McCormick-Deering ensilage cutter. Built in five sizes. Capacities from 3 to 25 tons of cut fodder an hour. All sizes have reliable safety devices, force-feed, large throat, and heavy flywheels of boiler-plate steel. Cutting and elevating done in one operation, saving power. Power required from 6 to 25 h. p.

If you want to husk the corn and shred the fodder, look over the line of McCormick-Deering huskers and shredders. Made in in 4, 6, 8 and 10-roll sizes, for individual and custom work.

McCormick-Deering Corn Pickers

THIS is the day of the corn picker. The McCormick-Deering goes through a field and picks, husks, and loads onto a wagon the crop on a half-dozen acres a day without anybody doing any unusual work. The husking is cleaner than average hand husking and many times as fast. This big-capacity machine is of suprisingly light draft; it has 37 roller bearings. One man and a tractor or 4 or 5 horses handle it. Ask the dealer or write us for information about the McCormick-Deering corn picker.

Free to Asthma and Hay Fever Sufferers

Free Trial of Method That Anyone Can Use Without Discomfort or Loss of Time.

We have a method for the control of Asthma, and we want you to try it at our expense. No matter whether your case is of long standing or recent development, whether it is present as Chronic Asthma or Hay Fever, you should send for a free trial of our method. No matter in what climate you live, no matter what your age or occupation, if you are troubled with Asthma or Hay Fever, our method should relieve you promptly.

We especially want to send it to those apparently hopeless cases, where all forms of inhalers, douches, opium preparations, fumes, "patent smokes," etc., have failed. We want to show everyone at our expense, that our method is designed to end all difficult breathing, all wheezing, and all those terrible paroxysms.

This free offer is too important to neglect a single day. Write now and begin the method at once. Send no money. Simply mail coupon below. Do it Today —you even do not pay postage.

AGE AND SIZE OF COCKERELS DETERMINE TIME TO CAPONIZE

WITHIN the last few years the business of producing capons has grown rapidly in this country, and increasing numbers of capons are being raised in the Middle Western States. During the winter months capon is regularly quoted in the markets of the large eastern cities. Massachusettes and New Jersey are the great centers for the growing of capons, while Boston, New York, and Philadelphia are the important markets.

The time of year when caponizing should be performed, so far as the effects of the operation and the rapidity and ease of healing are concerned, is of little importance. The capons seem to recover and do well at any time. Certain other considerations, however, do influence the time, says the United States Department of Agriculture. The age and size of the cockerel are very important. As soon as the cockerels weigh 1½ to 2½ pounds, or when 2 to 4 months old, they should be operated upon. The lower age and weight limits apply particularly to the American breeds, while the higher apply to Asiatics. If smaller than this, their bodies do not give room enough to work handily. On the other hand they should never be over 6 months old, as by this time the testicles have developed to a considerable extent, the spermatic arteries carry greater amounts of blood, and the danger of pricking these arteries and causing the fowl to bleed to death is greatly increased.

The fact that capons are in greatest demand and bring the best prices from the Christmas season until the end of March, and that it takes about 10 months to grow and finish them properly, makes it important to hatch the chicks in early spring so that they will be of the proper size for caponizing in June, July, and August. These are by far the most popular months for the operation, though in some cases it is performed still later.

CHICKS NEED SUNLIGHT AND YELLOW CORN

THE importance of sunlight and yellow corn in the growth and development of chickens is strikingly shown in a series of interesting experiments made at the Wisconsin University Experiment Station.

It has long been known that sunlight plays an important part in the development of all green plants, but the direct relation of this form of energy to animal life has but recently attracted attention. Nutrition studies during the past few years indicate that in some cases at least light may be almost as important a factor in the normal development of certain animals as it is in the growth of green plants.

Four groups of birds, each group consisting of ten White Leghorn baby chicks, were used in the experiments.

Group 1 received a ration consisting of 97 parts of white corn, 2 parts of ground limestone, and 1 part of common salt, and had free access to skim milk. The birds were confined in a runway in the basement of the poultry building with the windows closed. Group 2 received exactly the same ration as the first, but the birds were placed upon a board floor out of doors and exposed to sunlight during the day.

Group 3 received yellow corn instead of white corn and like the first group were confined in the basement of the building. Group 4 received the same ration as Group 3, but the birds were placed out of doors on board floors and in the sunlight in the same manner as Group 2.

Comparative Growth

Growth in all four lots for the first two weeks was apparently normal, due to the fact that the vitamine factors had been stored up in sufficient quantity in the egg yolks and the hatched chicks. After that time, however, the Group 1 birds practically ceased to grow, and all of the chicks soon died. The birds that received yellow corn instead of white corn and were confined to the basement made somewhat better growth, but at the end of five weeks all but two of the chicks had died. The remaining two reached a live weight of 340 grams, but from then on lost weight and died at the end of twelve weeks.

Both groups of chicks that were exposed to sunlight made remarkable growth. The chicks on white corn did unusually well at first, but ceased to grow after reaching a weight of 600 grams. At this stage they developed eye trouble and an unsteady gait accompanied by more or less dizziness. It became apparent that it would be impossible to raise chicks even in the sunlight with such a ration as white corn and skim milk.

The birds in Group 4 which lived on yellow corn, skim milk, and sunlight were in good condition throughout the experiment and showed every prospect of continuing their growth to complete maturity. All of the necessary factors of growth were available, a good protein mixture, ample ash, and the necessary vitamines. The birds produced eggs at the age of four months.

Overcoming Leg Weakness

The experiments showed clearly that diseases in chickens, such as leg weakness, which is a form of rickets, may be overcome by supplementing with sunlight and otherwise satisfactory ration. This is due to the curative or preventive power of the radiant energy of sunlight.

Other experiments showed that cod-liver oil, eggs, milk, and green feed are active agents in preventing leg weakness in chickens when fed during the early growing period. A number of groups of chickens fed separately with a ration consisting of 80 parts of yellow corn, 20 of middlings, 5 of lime rock, 5 of bone meal, and 1 of salt together with skim milk as a drink, made satisfactory growth although confined on a cement floor during the first six weeks of their lives.

It was found that no difference occurs in the time in which leg weakness develops as between chicks hatched from a ration of white corn plus pork liver, placed in the same brooder with chicks of the same age hatcher from a ration of yellow corn plus pork liver, and both groups fed on a ration known to produce leg weakness. The chickens fed on yellow corn made better growth than did those on the white corn ration. Most of the chicks from the white corn casein ration died within forty-eight hours after hatching, thus indicating the necessity of vitamine-rich feed (as found in the yellow corn) in the poultry ration to maintain the hatchability of the eggs.

Further experiments showed that whereas white corn and similar feed produce white yolks, and that yellow corn and green feed produce yellow yolks, a slight yellowness in egg yolks can be obtained by the feeding of yellow carrots.

The experiments proved conclusively that diseases such as rickets are the result of a deficnency of certain factors in the diet of animals, and that the substitution of yellow corn for white may overcome difficulties which have been encountered because of the lack of the fat-soluble vitamine in the grain. Further, that the use of green feeds of cod-liver oil has a pronounced influence upon the health and growth of various animals when fed on ricket-producing rations.

The production of hens, as well as the hatchability of their eggs, may to a very large extent be dependent upon the supply of vitamines in their food and the same factors have been found to be of particular importance in the normal rearing of young chicks which, because of their early maturity and relative sensitiveness, make splendid experimental animals for such studies. Wisconsin University officials feel that the practical application of these findings will have an important bearing in the chicken industry.—Farm and Ranch.

NO INTERNAL INSECTICIDE CURE FOR EXTERNAL PESTS

MANUFACTURING and selling preparations for controlling lice, mites, ticks (blue bugs) and other external parasites of poultry by serving to the fowls in their drinking water is a popular pastime of a number of concerns and one which the United States Department of Agriculture says should not be tolerated. A number of mixtures advertised for use in controlling external pests by administering in the feed have been tested by the Insecticide and Fungicide Board of the department and all have been found to be ineffective. Among the products which were offered as powders to be mixed with the feed are several containing mixtures of sulphur, charcoal, magnesium sulphate, ferrous sulphate, nux vomica, capsicum, sodium carbonate, napthalene, lime salt, and sand. Some of the mixtures were lime-sulphur solutions to be added to the drinking water; some calcium sulphide tablets of various percentages and having quantities of other chemicals as well. All were tested and found to be ineffective for the purpose advertised.

In view of these numerous tests the board has served notice on the manufacturers who may be selling or contemplate selling the above mentioned products to be used in this manner for controlling external pests of poultry that they are guilty of violating the provisions of the insecticide act of 1910, and that the products are misbranded. The board is of the opinion that these tests are sufficient to strongly indicate that such a method is infective and further that it is extremely doubtful if any substance will be found which will be effective when used in the feed, or drinking water. Tests have not been made of all of the mixtures advertised against all of the pests named, but, taking into consideration the tests which have been made and the anatomy and physiology of chickens, it is believed that it is unlikely that any of the substances proposed, or any combination of them, when fed to chickens will control any of the external parasites infesting them. These preparations are sold for the most part directly to consumers by parcel post.

BUMBLEFOOT

I have some hens that have a swelling in the foot. The first one I thought had hurt the point above the foot but upon looking at it found it was a large swelling and there was a scab on it nearly as large as a dime. That hen I killed. Then a few days afterward found two others had it. Can you tell me what it is and what I can do for it? I hate to lost all of my chickens and would sure be glad to get information on it.—L. H., So. Rockwood, Michigan.

THE swollen condition of the foot is undoubtedly a condition referred to as Bumblefoot. The cause of Bumblefoot is usually attributed to a mechanical injury, such as walking on gravel floors or runs, roosting on too wide perches or high roosts, combined with narrow buildings, necessitating the birds to jump and alighting heavily on their feet. The symptoms reveal a swollen condition below the foot, and between the toes. This swelling should be lanced and the pus removed, after which the foot should be treated with carbolated vaseline having been thoroughly cleansed.—E. C. Foreman, Professor of Poultry Husbandry, M. A. C.

Modern Efficiency

Mistress—"Mary, what a kitchen! Every pot, pan and dish is soiled; the table looks like the day after a cyclone! What have you been doing?"

Mary—"Well, ma'am, blessed if it be my fault. The young ladies has just been showing me how they bile a pertater at their cooking school."

GET YOUR COAL FREE

Special Offer to Michigan Business Farmer Readers

The largest concern of its kind in the world, exclusively delivering coal direct from car to consumer, with a long established successful record, the Popular Coal Company, 1509 Coal Exchange Building, Chicago, Illinois, is offering this unusual opportunity to one coal user in every neighborhood who has a few hours spare time. This is its method of quickly introducing the finest grade, freshly mined, free-burning coal, which is being sold direct to user at remarkably low prices. Man of good standing in his community can get his coal free. Write this firm today and ask them to explain this offer.—Adv.

Living the Full Life in the Rural Community

(Continued from Page 4)

basis, effecting tremendous economies in the central purchasing of farm supplies and giving to the widly scattered farmers a united voice which is beginning to speak for them effectively in transportation, legislation, taxation and other great matters where the interests of the farmers are vitally at stake and where individual action is futile but collective pressure is extremely effective.

All this is most encouraging as it indicates better social and economic conditions for the farmer, for once the agricultural interests learn to work in harmony they will find that they are the strongest class in the world. The bane of the past has been that the farmers have not realized the importance of cooperation. At best they have worked independently, and in many cases they have actually entered into competition with each other. This day is past, and everywhere we see evidences of rural cooperation — cooperative creameries, live stock shipping associations, fruit associations, potato exchanges, grain elevators, etc.

Now that the farmers have found their power, they will not relinquish the advantages which they have gained, but will continue along the lines which have already proved so successful. Thus they will come into their own and secure those advantages to which they are entitled as one of the greatest classes of producers of the basic wealth of the nation.

The brief review of agricultural conditions given above is merely suggestive and no attempt has been made to be exhaustive. Undoubtedly, anyone who is at all familiar with rural life can think of many other factors which might be included in even an elementary survey of this subject. However, the purpose of this article is merely to point out some of those factors which contrast so strongly with conditions in the restless, throbbing city, and which make the farm such an ideal place in which to live the full life.

Heading the Farm Call

May the young manhood and womanhood of this generation hear the call and feel the lure. It were indeed a catastrophe if they did not. It were little short of a tragic and ironical trick of fate if the young men who went forth and endured the terrible din and roar of cannons and all the hardships of war—all for liberty and better living conditions for mankind—should, now that they are back and fighting the battle of peace, voluntarily choose to live among the unnerving conditions of modern city life when all the advantages of life in the country are before them.

Let them select that occupation whose usefulness and dignity is unquestioned. Let them choose that life which makes them independent—which raises them above the position of mere cogs in the wheels of industry. Let them establish their homes where their children will grow up under their own careful guidance and training and not be away all day and use the home merely for a boarding place.

Let them choose their environment where the birds sing and all nature buds and blossoms, where God's power is daily revealed as the farm animals and crops grow and bring forth their increase, where the beams of the sunrise each morning light up a golden pathway of duty, where each sunset and peaceful twilight brings a benediction upon the day's labors, where each rainbow is a reminder of God's continuing mercy and favor.

Let them live where they daily catch inspiration, and where those wondrous thoughts come to them which slip through mere words and cannot be uttered but are no less deep and potent in their meaning and influence. Let them do all this and forsake the city streets where the sun beats down relentlessly and is reflected back from the pavements, where the dust laden wind sweeps down the canyon between the skyscrapers, where the beauty of the sunrise and sunset is obstructed by buildings and obscured by smoke clouds, where the wonderful verdure (God's covering for His creation) has been displaced by concrete and buildings, and where all the myraid voices of Nature are drowned in the road of the city's bustle and traffic.

'Tis thus I meditate as I sit here. The breeze stirs. A bird sings. The shadows begin to lengthen, reaching out hungry hands toward the east. The sun declines. I hear a whir, a roar. A motor car goes roaring past in a cloud of dust. Why, young man, are you in such haste? Do you seek happiness? Look about you. It is yours for the taking. The old motto comes home to me, "I would rather be able to appreciate things I cannot have than to have things I am unable to appreciate."

Let us learn to count our blessings, to look upon the bright side, to appreciate the distinctive joys and privileges of farm life and to take heart to fight the battle which each day may bring. Let us not be so busy attempting to earn a living that we fail to really live, to feel, to appreciate, to love.

And this is the thought which I would bring to each of the thousands of farm homes in THE BUSINESS FARMER family.

Isn't It So?

Teacher—"Jimmy, what is a fortification?"

Jimmy—"Two twentifications make one fortification."—School Journal

Good-Bye Mr. Canada Thistle

MICHIGAN is receiving the attention of a beneficent worm this summer, according to Prof. R. H. Pettit, head of the Michigan Agricultural College entomology department, who warns the farmers that they have nothing to fear from an inch and a half caterpiller with long forked spines in rows down its back. Numerous specimens of this caterpillar have been sent to Prof. Pettit by alarmed farmers and he states that examination reveals it to be the larvae of the thistle-butterfly, an insect fairly common during most summers, but occuring in large numbers this year.

This insect, confines its feeding habits almost entirely to thistles, with the Canada thistle as first choice at all times, according to Prof. Pettit. The insects occasionally will feed on burdock, elm, nettles and plantain, but never on any crop of value unless driven to it by starvation, in which case they may do some slight damage to soy beans and to peppermint.

"However, the coming of this creature in Michigan is really a blessing rather than a menace," Prof. Pettit said. "I think we can rest secure and watch these butterfly larvae destroy our bad weeds without incurring any expense. In any case the larvae are due to pupate very soon, and change into beautiful butterflies, so no one needs to worry about this very unusual invasion."

And now, apparently unheedful of the ravages already suffered this year by the Canada thistle from the thistle-butterflies, Howard C. Rather, M. A. C. farm crops specialist, announces that the growing of alfalfa is one of the best ways of eradicating Canada thistles.

If the infested fields are not seeded in the spring, are then plowed, and finally seeded to alfalfa during the first week in August or at the end of the droughty season, the thistles will be held in check until the alfalfa has made a start.

In the next year the thistles will be killed out by the frequent cuttings of alfalfa, Mr. Rather states, adding, however, that "the alfalfa will do little toward the eradication of the thistle the first season.

"In securing a seeding of alfalfa, only northern grown seed should be used," he advises. "The Grimm and other varigated strains are well adapted to Michigan conditions. The seed should be inoculated and the seed bed should be well firmed. If the soil is acid, an application of lime should be made."

A Personal Word of Warning before you buy your Fertilizer

In my forty years experience, conditions in the fertilizer field have never been so uncertain or so threatening to the careless buyer.

Too much talk is being given to what fertilizer costs and not enough to what goes in it. Cheap fertilizer can be as expensive as a cheap lawyer in a big lawsuit. I have given the best years of my life to the development of high grade fertilizer, and these years have taught me one fact I want to pass on to you; and that is, that I can make a given analysis to sell pretty nearly as cheaply as I want, if that's what I want to do!

In the early stages of the fertilizer business I saw that the real future lay in trying to make the *best* fertilizer I could, and that there were always enough good farmers willing and anxious to pay a fair price for the best. Because, after a few seasons of experiment with cheap fertilizers, the sensible farmer realizes that fertilizer is cheap or high only according to the results it brings, and that therefore, any fertilizer short of the very best is dearly expensive in the long run. My ambition, therefore, became fixed on working out formulas and processes that would every year improve the quality of my goods.

FRIENDS FOR 30 YEARS

Every year my business grew. More and more farmers discovered the cheapness of high quality fertilizer. Some of my customers have been using nothing else but my "Royster" fertilizer for 30 odd years. Many seasons I have been unable to make enough to supply all my orders. Last season I had a record-breaking sale, yet in some states farmers who wanted "Royster's" high grade fertilizer had to go without it, even tho they were glad to pay more for it than for ordinary fertilizer.

It takes time, care and experience to make "Royster's" fertilizer. For instance, every ton of it is "cured" or aged for at least three months, after mixing, to insure perfect chemical and physical condition, and *no pressure of orders on hand will make us shorten this curing period* just in order to sell more goods. This sort of care for the "Royster" reputation for unsurpassed quality has won me the confidence and trade of millions of farmers, which I value and esteem zealously.

THEY'LL ROT FIRST

This personal word of warning is written to tell you that I am out of the competition now going on to see who can make the cheapest fertilizer. I am going to plug along making the finest quality goods I can, to sell at a few cents a ton profit above cost of manufacture. Before I consent to change the quality standards of the F. S. Royster Guano Co., I would shut every door of my factories, pay off every employee, and see the buildings rot away in idleness. For your own sake, deliberate carefully this season before you buy your fertilizer. If you decide to invest in "Royster's" quality fertilizer, you have my personal promise that you will never regret the purchase after you see the results. It isn't so much what you put into it, but what you get out of it, that counts in buying fertilizer. F. S. Royster Guano Co., Norfolk, Va., Baltimore, Columbia, Toledo, Montgomery, Atlanta.

Foote Advises Orderly Wheat Marketing

If Farmers Increase Wheat Average, Lower 1925 Prices Will Result—Future Bright For Live Stock Market

By W. W. FOOTE, Market Editor.

FORECASTING the future of the grain markets is a delicate matter always, and trying to figure out the wheat market a year ahead is obviously some job; but this is involved in the question put by a Michigan farmer who writes asking: "Will you please advise me when to sell my wheat? Also, would you advise sowing a large wheat acreage this fall?" To be frank, I will say I do not know whether it is best to sell now; but it is an old saying that it is a good thing to accept a good price when it is offered, and ruling market prices look good to many old-timers in the leading wheat growing districts. However, there has been a quite recent reaction in prices for wheat for future delivery, and perhaps it would be well to wait for advances of a few cents a bushel before selling; and it might be a good thing to sell from time to time, and take only moderate chances of lower prices. Personally, it seems best not to look for the highest possible prices and taking chances of reduced values in the end, for there is always a limit, and "a bird in the hand is worth two in the bush," you know. Now as to sowing a large acreage in the coming autumn. Every farmer knows that high prices for wheat or anything else are sure to result in an enlarged acreage, and should the crop do well, the ultimate outcome would naturally be a corresponding fall in prices. Therefore, would it not be the safer policy to devote only a fair average number of acres to winter wheat, and thereby avoid the danger of too much loss from a possible fall in prices? In short," don't put all your eggs in one basket." which is just as true advice as was ever given by wise men. To a certain extent every farmer is a speculator in raising crops, and diversifying his crops has always proved a good safety valve. Specialists in single lines often make large profits, but diversified crops offer to the average cultivator of the soil the surest returns, and it is a mighty good thing to look to the farm for raising most of the food used by the family.

August Crop Report

The crop report for August made by the Department of Agriculture was a surprise, as it made the wheat and oats crop larger than we expected, and the corn crop much smaller. The wheat crop this year will total 814,000,000 bu. compared with 786,000,000 bu. last year, the department of agriculture estimated. This is an increase of 74,000,000 bu. above the department's July 1 estimate of the crop, which was followed by sky-rocketing prices.

Winter wheat, with an estimated yield of 16 bu. per acre from 36,898,000 acres under cultivation, will account for 589,000,000 bu. of the total. Spring wheat condition, which on Aug. 1 was 79.2 per cent of normal, will, on the basis of a yield of 13.2 bu. per acre from 16,920,000 acres sown, produce 225,000,000 bu., the department estimated.

The average price of all wheat on farms July 15 was $1,058, against 89.6 cents last year.

The corn crop will amount to only 2,576,000,000 bu., against 3,046,000,000 bu. Aug. 1 was 70.7 per cent of normal, against 72 per cent on July 1. Yield per acre was estimated by the department at 24.4 bu. from 105,604,000 acres in cultivation, with a farm price of 98.3 cents per bu.

An oats crop of 1, 439,000,000 bu. is promised, which will compare with 1,300,000,000 bu. last year, and is the largest yield since 1918. Stocks of oats on United States farms Aug. 1 were only 65,256,000 bu. compared with 92,982,000 bu. on the same date last year.

Farm Products Go Higher

Better times have dawned for farmers at last, and substantial advances in prices have taken place during recent weeks, the upward movement including fat cattle, as well as hogs, the rise in swine being unexpectedly large. Lambs have sold satisfactorily on the whole when they were well fattened, but owners have been apt to glut the market and thereby enable the packers to force prices lower. The future certainly looks much brighter for live stock, while the grain markets have been placed in the strongest position experienced in a long period. There is no longer any good reason to resort to unusual methods for putting wheat on a higher basis, and this is also true of corn, oats, rye and barley. It is simply a matter of supply and demand, farmers having curtailed their wheat acreage, while nature did the rest, the crop in some districts having been reduced by bad weather. Fortunately, there is a fine, large crop of oats, while the rye crop is fairly good, but it is generally admitted that the corn crop is bound to turn out a short one owing to the unusually late start because of cold and rainy weather and a repitition of this since then. Looking into the future so far as is possible, it may be said that some farmers face a partial crop failure, while others will probably harvest a good crop. Those who have good crops of corn may be expected to have their wealth much increased, while the others will fare poorly in spite of high price. Corn looks spindly on untiled fields around Chicago, but plenty of drained fields present a good appearance. The many gardens of vegetables are turning out finely, and the wayside sellers are doing a thriving business. Farmers have been busy as a hive of bees, making hay and plowing their corn fields, and to a much greater extent than ever before farm machinery is taking the place of expensive hired farm workers. Farmers are also using large numbers of motor trucks, and apparently the farmer who owns no automobile is an exception. Not many farms are being sold, and fewer farm mortgages are being made than in past years.

Great Market for Wheat

In every way the wheat market has been a big one, including the volume of business and the boom in prices. During a recent week sales of wheat on the Chicago Board of Trade aggregated considerably more than 331,000,000 bushels, and in the same time prices advanced 9⅝ cents, with July taking the lead. Prices a short time ago reached the high point this year, with reactions later, as was natural after such a sudden boom. The advances in prices which have taken place were due to world conditions, and the improvement is legitimate, with much larger trading in cash lots than last year. Prices have been raised to the highest figures of the year, and sales were the largest of the year. Winnipeg has taken the lead in the advance, that market having gone up as much as 12½ cents in the course of a week. It is natural that the Canadian market should attract a great deal of attention at this time, as Canada, Australia and Argentina are the largest surplus growers of wheat, and a reduction in the wheat crop of Canada means much to the European countries which are short on home crops of grain. Foreigners are good buyers in American markets, and large purchases for export are reported. Active movement of new wheat from the southwest is increasing the visible supply materially, and at last stocks are much larger than a year ago, while exports of wheat and flour are making a good showing. The oats crop is turning out fine, but corn promises to be a short crop, and startling advances have taken place. Very little corn is being shipped out of the country, but good exports of oats and rye are reported. Late sales were made of wheat for September delivery on the Chicago market around $1.30, September corn at $1.15½, September oats at 52¾ and September rye at 95 cents.

Chicago's Cattle Market

The recent greatly delayed appearance of summer hot weather exerted a depressing influence in the cattle market, the consumption of beef being checked temporarily, and prices averaged lower for steers and other beef cattle, although some prime heavy cattle and tip-top yearlings went at comparatively high values. Choice heifers also made some high profits for their fortunate owners, and among the most noteworthy salesman may be mentioned those of 52 heifers averaging 884 pounds at $9 and $12 heifers averaging 1002 pounds at $10. But it is the rank and file of the cattle that comprise the real market, and these sell far below prime lots. The other lots of cows and heifers have been selling at $4 to $8.75, with a canner cows at $2.25 to $3.50, bulls going at $3.50 ot $7 and calves at $4 to $11. Beef steers sold at $5 to $7 for inferior light weights up to $10.75 to $11.40 for the better class of long fed lots, no good steers selling under $9 and the best yearlings taken at $10 to $11. The stocker trade was slow at $5.50 to $6.50 for the greater part of the offerings, with inferior stock steers salable at $4.25 and over, the demand being mainly for cattle for grazing, ear corn checking grain feeding.

A year ago beef steers sold at $5.50 to $12.25. Combined receipts of cattle in twenty markets for the year to late date amount to 7,420,000 head comparing with 7,568,000 a year ago and 7,130,000 two years ago. Within a week cattle prices declined 50 to 75 cents.

The Advance in Hogs

Big advances in prices during recent weeks were wholly legitimate, due to greatly reduced receipts in Chicago and other markets as compared with supplies earlier in the summer packing season and a year ago. Not only were the Chicago packers liberal buyers, but buyers for shipment to eastern packing points also bought many of the choicer class of hogs, and this made keen competition in the market. Better grades of heavy butcher hogs were the favorites with buyers and topped the market, going away above prime light bacon hogs. The boom in hog prices has caused substantial advances in fresh and cured hog products, and exports of cured hog meats have been running much smaller than a year ago, while lard exports were much higher. For 1924 to late date combined receipts in twenty markets amounted to 26,334,000 hogs, comparing with 25,859,000 a year ago and 20,038,000 two years ago. A year ago hogs sold on the Chicago market at $6 to $8.15. The past week's receipts of hogs amounted to only 134,775 head, comparing with 146,871 a week earlier and 179,024 a year ago. Active buying put prices up to $8.25 to $10.35, comparing with $7.85 to $9.90 a week earlier, heavy butchers and light bacon lots going at the top.

The Sheep Industry

Most of the time well finished lambs offered on the Chicago market are in good demand at rather high prices, selling well above prices paid one, two and three years ago; but now and then the market is overstocked after advances in prices resulting from small receipts, and this causes declines in quotations. Breeding ewes are much wanted, but not many are offered, and prices are high, with sales at $7 to $11.25, yearlings selling highest. Feeding lambs have been selling at $12 to $13, nowhere near enough being offered. A year ago $12.70 paid for the best killing lambs. Despite greatly increased Chicago recepits of lambs last week, prices advanced, lambs selling at $8 to $13.90.

The Bean Crop

As summed up by the Bean Bag and Pea Journal, pea beans are strong, and the price outlook looks promising for higher prices. This is in the face of surface indications of another bumper Michigan crop, but there are a number of contributing causes. The Michigan crop will be later than usual, probably two to three weeks later. There come disquieting reports of heavy damage from the bean maggot. The government crop report just issued gives a condition of 87 per cent against 91 per cent a year ago at this time, but many observers say the maggot damage will astonish the nation when its ravages finally become known. California's white bean acreage and estimated production are cut to an alarming extent, so much so that Michigan's pea beans will form practically one-half of the entire production of beans in the country this year. Colorado and New Mexico are about to produce a crop half again as large as last year, but these are pinto beans, and not strictly in competition with the white bean. New York will show a small increase in production.

HASTE IN MARKETING WHEAT CROP MAY CAUSE LOSS TO FARMERS

Millions of dollars may be lost to Michigan farmers through wet wheat, according to Grand Rapids millers, who say they are astounded at the high moisture content of wheat deliveries. The grain, in many instances, gives evidence of having been threshed before it was given an opportunity to properly dry in the shocks. The moisture content of wheat, as well as other farm products, is higher than normal this year because of the heavy rains.

"Millers are finding an alarming condition in this year's wheat crop," said Lee H. Higgins. "The crop passed all expectations as to quality and quantity, but in their haste to market some of the crop or, in many cases, to accommodate threshing crews, farmers have hauled and threshed wheat that was not thoroughly dry. Much of this wheat will heat in storage and become almost a total loss. Even in cases in which farmers have made an effort to dry the grain after threshing, they have had trouble saving it.

"The only proper place to dry wheat caught in the rain after it has been cut is in the shock. Threshing it immediately and attempting to dry it later is a great risk." The maximum moisture content in new wheat, it is said, should not be more than 14 per cent, but Higgins says three samples taken recently showed 17½, 18⅛ and 20½ per cent moisture.

Michigan interests are working on a plan to inaugurate an advertising campaign of their own. It is planned to get the growers to spend one cent per bag and the elevators another cent a bag. If this goes through an enormous fund can be created and if judiciously used, not only Michigan but all the bean states will see a direct benefit.

BEANS

The latest figures place the crop at 13,688,000 bushels. Michigan leads with 6,242,000 bushels, followed by California with 2,059,000, Colorado with 2,010,000, New York with 1,746,000, Idaho with 775,000, New Mexico with 704,000, Wisconsin wiht 117,000, and Arizona with 35,000. The total crop in 1923 was 15,740,000 bushels.

POTATOES

The estimated potato crop of the United States is 398,821,000 bushels, which is only thirteen and one-half millions less than the final production figures for last year. Minnesota is in the lead with a report of with 37,662,000 and Michigan is 39,196,000; New York is second third with 31,611,000. Other important states report as follows: Maine, 28,275,000; Pennsylvania, 24,595,000; Virginia, 18,720,000; Ohio, 10,055,000; Wisconsin, 28,125,000; North Dakota, 13,845,000; Colorado, 11,314,000; Idaho, 10,613,000; California, 6,594,000; and Washington, 6,248,000. The Michigan crop is in excellent condition in all except a few counties, and eight per cent above the ten-year average and six per cent better than one year ago on August 1, according to the official reports.

PRITCHARD'S WEATHER FORECAST
INTERPRETED BY THE STARS

Week of August 17

TEMPERATURES in Michigan will average below normal for the week of August 17th while we are expecting the rainfall to average above the normal quantity.

During the first part of the week many electrical storms will visit numerous sections of the state. These storms with heavy local rains and moderately strong winds will be more noticeable about Sunday and Wednesday.

On or immediately after the middle of the week the temperature will take a sudden drop and fail to rally much before the end of the week.

About the last day of the week temperatures will rise somewhat above normal and storm conditions will increase. The rainfall period will run into next week but it will not be general nor plentiful.

Week of August 24

Following the threatening and showery conditions of last of last week and first of this, the weather will become pleasantly cool and fair. The week, as a whole, will be clear and cool yet there may be expected the usual summer thunder storm. We look for no hot, sultry weather in Michigan this week.

This week ends with the weather becoming unsettled and theatening. During Friday and Saturday following a sudden rise in the temperature, atmospheric conditions will develop into moderately heavy rain and thunder storms.

June Forecast Correct

With only 12 hundredths of an inch of rainfall above the normal in Michigan for June our forecast "precipitation will not average far from normal" was again correct. Our forecast of a cool June was also correct when temperatures averaged two degrees below normal.

LIVE STOCK MARKETS

DETROIT, Aug. 13.—Cattle—Receipts 378; market steady but slow. Fancy yearling, $8.50@9.25; best heavy steers, $8.25@8.75; best handy weight butcher steers, $7@7.75; mixed steers and heifers, $6@6.50; handy light butchers, $5.50@6; light butchers, $4.75@5; best cows, $5@5.50; butcher cows, $3.75@4.50; common cows, $3; canners, $2@2.75; choice light, $5@5.50; bologna bulls, $4.50@5.25; stock bulls, $3.50@4.50; feeders, $5@6.50; stockers, $4@5.50; milkers and springers, $45@85.

FREE BOOK ABOUT CANCER
The Indianapolis Cancer Hospital, Indianapolis, Indiana, has published a booklet which gives interesting facts about the cause of Cancer, also tells what to do for pain, bleeding, odor, etc. A valuable guide in the management of any case. Write for it today, mentioning this paper. (Adv.

How many bushels of wheat?

Does potash pay on winter wheat? Decidedly *yes!*

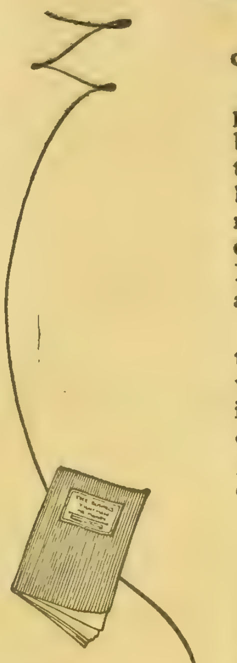
Right here in Michigan $1.75 worth of potash increased the yield nearly 4½ bushels per acre—and at $1.10 a bushel the potash not only paid for itself but brought in a $3.00 extra profit. The formula used was 3-9-10, and it was tested out by your own Michigan Agricultural Experiment Station, against no fertilizer at all and against 3-9-0, a no-potash formula.

Yes, *potash pays*. And in your rotation system potash that you apply to wheat also increases the yield of succeeding crops. The potash that gave $3.00 extra profit on wheat also brought in 160 pounds more clover and 36 bushels more corn than the no-potash formula.

All from $1.75 worth of potash!

Potash strengthens the stalk and prevents lodging of the grain under high winds and heavy rains. Your wheat will be harder, plumper and the shrinkage will be less. Your grade will be improved with potash—adding still more profit per acre to your income.

Make money on winter wheat. Insist upon having 6% to 10% of Genuine German Potash in the fertilizer you buy. The extra bushels you get take no more seed. You'll be glad to pay the slightly increased threshing charge.



The Bushels That Made Me Money

You should read this interesting story before you plant your winter wheat. Your copy will be sent free of all cost. Simply ask for booklet, "The Bushels That Made Me Money." But do it now!

PAPEC
The Biggest Value in Ensilage Cutters
Throws And Blows
Saves One Man

THOUSANDS of farmers agree that the Papec is the biggest value in ensilage cutters—simple, rugged, long-lived. Fills the highest silo without plugging the pipe. Light of draft; costs less to operate. Every part is easy to get at.

The Papec is made in four sizes: R-10; N-13; L-16 and K-19. A gasoline engine, developing 3 h.p. or more, will operate the R-10 size. Any tractor can be used with the medium sizes. For heavy tractors use a K-19 Papec—capacity practically unlimited.

Write for free catalog and U. S. Gov't Bulletin "Making and Feeding of Silage." Every silo owner should read them. Mention size of your silo.

MEET US AT THE FAIR

THE BUSINESS FARMER believes in the County, District and State Fairs as great educational centers for the farmers.

Thousands of our readers will attend the fairs all over the state this fall, and we want you to know we will have representatives at all of these fairs to renew your subscription and to take your friends new subscription to the only farm paper owned and edited in Michigan The Business Farmer.

We want our representatives to take care of you in a courteous business-like manner. If in doubt about their methods demand that they show you proper working credentials and should there be any misunderstanding write me.

Attend the Fair—Renew Your Subscription There

and tell your neighbor to take the paper so his family can enjoy the things you enjoy in The Business Farmer.

R. J. McCOLGAN,
Circulation Manager.

THE PERFECT MOTOR OIL

Made in Five Grades

TRACTOR owners are among the heaviest users of Polarine. They are compelled to use a lubricant that saves parts, because a breakdown in the midst of agricultural activities is costly. The experiences which many tractor operators have related to us prove that Polarine is a superior lubricant for tractors.

Merriman Brothers of Deckerville, Michigan, write:

> "We own and farm over 500 acres of land, and we have used Fordson tractors during the last 4 years.
>
> "We have done a great deal of shopping around on tractor oils, trying all of the well-known brands, and have now proved to our satisfaction that your Polarine Heavy is the best oil obtainable for the lubrication of the Fordson Tractor."

There is a correct grade of Polarine for your car, tractor or truck, no matter what make it may be. And when you use this grade, you will note both a marked saving in fuel and a marked drop in repair cost and renewal of parts.

Polarine actually makes tractor fuel go further. This is because Polarine is scientifically made. It forms a perfect seal about the piston to conserve the power your engine develops.

Polarine saves parts because it reduces friction to a minimum. It maintains its body under all working conditions. It does not break down.

Don't experiment. Don't risk layoffs in your busy season. Use the correct grade of Polarine throughout the season. Then compare your tractor's performance under these new conditions with its performance last year. You'll be pleased with the improvement.

HUDSON'S

43rd Anniversary Sale

Begins Tuesday Sept. 2

This Anniversary Sale is the most important Hudson merchandising event of the entire year.

For months we make careful preparations for it in markets not only of America but of Europe and the Orient.

Every department is represented. Hundreds of special values all over the store.

We wish particularly to emphasize that every offering is of new Fall and Winter merchandise of Hudson quality at very definite savings.

You will find Hudson's an interesting, friendly place to shop. You will find the Anniversary savings well worth while.

Anniversary Sale Begins Tuesday, September 2, During State Fair Week—"Ever'body Comes"

Michigan Beet Growers Demand No Tariff Cut

Reduction at this Time Would Imperil Beet Growing in America—Farm Bureau, Dairy Interests and Others Rally for Defense

By STANLEY M. POWELL

(Lansing Correspondent of The Business Farmer.)

SUGAR beet growers of Michigan possibly do not all realize that there is a movement on foot which if carried out would be anything but beneficial to them. There is a menace not generally appreciated in the recommendation recently made to the President by three members of the Tariff Commission that the duty on sugar be reduced.

Michigan sugar beet growers do not need anyone to tell them that if the tariff on foreign sugar is materially reduced it will undermine the price of sugar in the United States until beet fields which now bring in a little profit would actually be operated at a loss.

Especially now that such a large proportion of the Michigan beets are being grown under a participating contract, sugar beet growers are vitally interested in everything which affects the price of sugar.

Means Much to Us

The sugar beet growing industry is just getting nicely established in Michigan. In 1923 there were 131,000 acres planted to beets, of which 109,000 acres were harvested. This season 174,000 acres were planted. Thus the industry is on the gain and if it receives no serious set-back it appears destined to become an important factor in Michigan's agriculture.

It might be timely to state that sugar beet production in Michigan is a far more important factor in influencing the cash incomes of our farms than is commonly realized. During 1923 Michigan farmers received $8,240,000 for their sugar beet crop. This is more than one-eighth of the $62,333,000 which constituted their total cash income from the sale of all farm crops, exclusive of fruit and truck produce.

The total value of all farm products produced in Michigan last year was $242,472,000, but as stated above, only $62,333,000 of these crops were sold as cash crops, while the balance was consumed on the farm, fed to live stock, etc. However, 100 per cent of the sugar beets produced were sold directly so the price of sugar beets is a big factor in determining the cash incomes of our farms today, and promises to be more so in the years to come.

Last year Michigan forged ahead to second place among the several states as a producer of sugar beets. Colorado had a production of 2,360,000 tons, Michigan 1,273,000 and Utah 766,000 tons. Thus Michigan grew more than one sixth of the 7,439,000 tons of sugar beets which were produced in the United States last year, and which are reported to have yielded 951,000 tons of beet sugar. These few figures prove conclusively that Michigan farmers are profoundly interested in the retention of the present sugar tariff schedules.

Manufacturer Agrees

Commenting of the present situation Mr. W. H. Wallace, General Manager of the Michigan Sugar Company, says,

"Michigan farmers and farm organizations can consistantly ask that no change be made in the tariff on sugar, considering the fact that now under the present contract they are just as much interested in the price received for sugar as the manufacturer.

"Why the Commission would spend days listening to the Cuban planters, and not offer to give the United States beet grower an opportunity, is beyond me.

"Just following the War we had an evidence of what the Cubans would do to us, if they had an opportunity. With worlds of sugar in their warehouses, they raised the price of sugar to 24c to 30c. Still the Democrats would turn over to them absolute control of the Sugar market, if they could. The fact that the United States was producing a large amount of beet sugar saved the people millions of dollars during the War.

"It is just a question between beet growers and manufacturers of the United States on one side, and the Cubans with Wall Street, and the Sugar Trust behind them on the other side.

"Wall Street has invested a lot of money in Cuban sugar plantations during the War, and they are making extraordinary efforts now to get the matter into their own hands and get another wallop at the American people, and get their money back."

Michigan sugar beet growers do not stand alone as parties interested in no downward change in the present tariff. They have been joined in their protests by producers of sugar beets and sugar cane in all parts of the United States. Nor is that all. Now the corn growers in the midwest states are adding their protest to that already voiced by western and southern cane and sugar beet growers that the sugar tariff be not lowered. This demand has become insistant since the recommendation of the three members of the Tariff Commission to the President that duty on sugar be reduced.

Corn and Sugar

The corn growers are interested in the sugar tariff because molasses is on an interlocking schedule and if sugar is lowered, molasses will also come down and molasses will enter into direct competition with about fifteen per cent of the commercial corn.

A great amount of soft corn this year promises to add a good premium to the corn growers' price on the 400,000,000 to 500,000,000 bushels which make up commercial demand of corn in the United States. But if the sugar tariff is lowered the corn growers see part of this anticipated profit fading.

About 30,000,000 bushels of corn are used in making glucose and about 40,000,000 bushels are used in distilling and in mixed feeds. It is evident that the importation of sugar and molasses come in competition with about 70,000,000 bushels of corn, or fifteen per cent of the commercial corn movement. This, of course, is large enough volume to affect the entire corn price.

Ordinarily the dairy interests would be eager for a reduction in the molasses tariff from the advantage they would have in reduction of mixed feeds. However, this year it is becoming apparent that the dairy interests are wanting the tariff kept on sugar since they are after an increased protection on casein and butter.

The American Farm Bureau Federation has pointed out in statements that the proposed reduction on sugar tariff would seriously handicap sugar cane growers in Louisiana, Mississippi, and Arkansas, as well as large sugar beet areas of Colorado, Utah, Nebraska, Wyoming, Montana, Idaho, Nevada, California, Oregon, and Washington, and in addition to these western areas sugar beets are becoming an important crop in Michigan, North Dakota, Wisconsin, Ohio, Indiana, and Minnesota.

Farm Bureau officials have also pointed out that the sugar beet industry is just reaching an important size in states where diversified farming is being urged, and that in Utah and Idaho alone this year a $15,000,000 crop is anticipated. This crop has been produced at great cost and if anything occurs that materially reduces the return it will cause serious economic suffering in those states.

To Protect Americans

The question seems to be pretty fairly set that our domestic sugar is raised on lands which pay American taxes and command American prices, and by people who maintain American standards of living. If the sugar tariff is lowered this sugar industry will be very seriously handicapped.

As to the actual figures in the case, farm bureau statistics show that the United States consumes about 30 per cent of the world's entire production of sugar. About one-fifth of this is produced in continental United States; almost one-fourth is produced in the territories of the United States and enters duty free. This leaves something over half of the United States consumption to be imported under duty. About 90 per cent of the imports under duty comes from Cuba.

The full tariff duty on sugar on specified grade is 2.2 cents per pound for the specified grade.

In a study made by the Research Department of the American Farm Bureau Federation in 1922, it was estimated that producers of sugar in the United States receive an advantage from tariff duties of about $50,000,000 per annum. The sugar tariff is a vital matter to them. Michigan growers, who produce one sixth of the sugar beets of the nation, are especially interested.

FARM BODY SPEAKS

BECAUSE of the situation outlined, the Michigan State Farm Bureau has been watching developments with great interest. It has filed formal protests to the proposed tariff revision with both its Washington office and with C. Bascom Slemp, Secretary to President Coolidge. At the August meeting of the State Farm Bureau Board of Directors, the following resolution was adopted:

WHEREAS, it appears that a determined effort is being made by certain interests to secure a reduction in the tariff on sugar being imported into the United States.

AND WHEREAS, three members of the Tariff Commission are reported to have recommended to the President that the duty on sugar be reduced,

AND WHEREAS, any such action would be detrimental to the farmers of Michigan who are engaged in sugar beet production, and especially so because of the participating contract which is now in operation between the beet growers and the manufacturers in this state.

AND WHEREAS, we regard a healthy and prosperous domestic sugar producing industry as the best possible protection and insurance against exhorbitant prices being charged American consumers by interests which might be in control of the cane sugar industry,

AND WHEREAS, since both labor and industry are today given the benefit of a system of protective legislation, it is only equitable that farmers should be granted a reasonable tariff, especially an these products of which there are substantial imports, thus making possible that such tariff wall shall provide real protection,

AND WHEREAS, we further realize that the growing of sugar beets efficiently utilizes a large acreage which would otherwise be producing other crops of which we already have a distressing surplus.

NOW THEREFORE BE IT RESOLVED that we strenuously oppose the above-mentioned reduction in the sugar tariff and strongly urge that no action be taken until the sugar beet producers of this and other states and the sugar cane growers of the Southern states have been permitted to appear and present their arguments against the proposed change.

MICHIGAN STATE FARM BUREAU BOARD OF DIRECTORS.

"Come and Camp on the State Fair Grounds!" Says Dickinson

GEORGE W. DICKINSON, manager of the State Fair is a busy man these days getting ready for what, he admits, will be the greatest exposition ever held in the state of Michigan, but he had time to talk to a representative of The Business Farmer who interviewed him Friday.

When asked if there would be a camping site again this year for farmers and their families who drove down to the fair, equipped with tents to stay over one or more nights, Mr. Dickinson replied, "Sure thing, tell as many to come that way as possible and we'll try our level best to make them feel at home on the grounds. There are plenty of toilets, running water and good restaurants right handy to our camp site. It will take more than one day to do the state fair this year in the right way and those who come a long distance do not want to drive home after the night shows. Everybody is welcome and you know everybody comes!"

It was The Business Farmer which first suggested a free camping site on the state fair grounds and we hope a lot of our folks will accept the invitation this year. Why not get your friends to join you?

Livestock is Great Britain's Pride

A Visit to England's Royal Livestock Show, the First of a Series of Articles

By **FRANCIS A. FLOOD**

THIS is the first of a series of articles by Mr. Flood, who is a member of the Agricultural Editors Association party which went to Europe this summer to study conditions. (See picture on opposite page.) Mr. Flood is a thoroughly trained agriculturalist and has made a wide circle of friends in the west, where for several years he has contributed articles of travel to the leading publications. You can follow this series with the assurance that your time will be well and interestingly spent.—Editor.

Mr. Flood holding a box of giant prize-winning strawberries at the Horticultural Exhibit of the English Royal.

EVERY Englishman, from the humblest dairy hand to the be-medalled commander of the King's Royal Horse is personally interested in England's livestock.

The eighty-third annual Royal Livestock Show held this year in Leicester, England, was a great success, and the writer, coming from America's middle west which, according to popular superstition, is distinctly a cattle country itself, the great show was a revelation of England's mastery in the field of livestock.

This over-crowded little island with its millions of people bulging out over the stonewalls and hedges into the pasture lands of cattle and sheep, and with its thousands of towns and large cities denying space for the cultivation of forage crops has, in spite of all this, a denser livestock population than any of our own great cattle raising states in America.

A mutton chop and a mug of ale are as distinctly English as pretzels and beer are German, and the "Roast Beef of Old England" is a fact and not a fancy. For with all her industries, people, monuments and premiers Merrie England is jolly well holding her own in her pastures as well as on her seas.

The Royal Livestock Show, as everything else in England, is as old as our own great country is young. It began eighty-five years ago and has been held annually ever since except for two years during the war.

The show is nomadic and is held in a different place each year. It was last held in Leicester in 1896. The Englishman is appalled at our method of wasting the great acreage which we set aside in each state to be used for no other purpose than to stage our state and county fairs each year. The buildings and equipment used in connection with the English Royal Livestock Show are temporary and can be taken down and moved, as the Arab does his tent, to a new place each year, without permanently wasting any valuable ground.

The foot and mouth disease, now so prevalent both on the continent and in England, seriously threatened the holding of the show this year, but with strict examinations rigidly enforced the show was held as usual although the entries were considerably curtailed.

There were twenty-one breeds of beet and dairy cattle numbering 1302 individual entries in all. Most of these were dairy breeds with the familiar Milking Shorthorn the most numerous. The British Friesian, which we call the Holstein-Friesian in America, was next in numerical popularity with the beautiful Jerseys a close third.

Friesians, but not Holsteins!

The big, black and white British Friesians are as nearly identical with our heavy milking Holstein-Friesian as can be expected with 3,000 miles of water between, but the "Holstein" and the "Schleswig" part of it is left entirely out of the name. Certainly these two families of the same stock are much more similar to each other than we, ourselves, are like our British cousins. Yes, we are certainly different, but I will be charitable to them and not record here which branch makes the better showing today.

The numerical balance of these entries seems to represent fairly accurately the popularity of the different dairy breeds actually on the English farms as we observed them after driving over most of the southern and central shires. The Friesians have supplied the only British cows, sixteen in number, that have produced 1,000 pounds of butter in one year; they have supplied the five 3,000 gallon cows in Europe, the only 2,000 gallon heifer in Europe and 134 of the 146 British 2,000 gallon cows. It must be remembered that in these measurements the British Friesian operates under a handicap for the English gallon is about one-fifth larger than our own gallon. Start her gallons from scratch and her records command respectful attention. But in spite of these records the Milking Shorthorn is still the ranking favorite of the English dairy herdsman, partly perhaps, because it is distinctly of English origin, but no doubt mainly because he knows the milking shortly is just naturally the best cow for his job.

Interesting Types

The little black Dexter cows which except for their short legs and mature form look more like yearling calves than milking matrons are quite common on the English farm and an interesting type to study at the show.

There were twenty-seven breeds of sheep totalling 633 individual entries, most of which were mutton type. The Oxford Down, Shropshire, Hampshire Down, Suffolk Lincoln, and Romney Marsh were the most numerous. We were disappointed in driving for three hours through the heart of the famous Southdown district before seeing a single band of these sheep, and we wondered if they were disappearing. The fact that only seven Southdowns were exhibited at the Royal Livestock Show would support this conclusion.

The Englishman loves good horses! It isn't necessary to attend a stock show to see that trait of the Britain for it is in evidence throughout the island. There is a great deal of horse traffic in the crooked streets of London and no matter whether they are a team of slapping Suffolks pulling a beer wagon over London Bridge, or a solitary Shire hitched to one of those monstrous two-wheeled carts, the proud Hunters along the bridle paths through Hyde Park or drilling with the King's Horse Guards in St. James' Court, or the Countless Hackneys and Coach Horses still competing so efficiently and impressively with the taxicabs in London—no matter what the job or the breed of these British horses they are English bred and English groomed and reflect the Englishman's pride in good horseflesh.

There were eleven breeds of hogs shown at the English Royal, totalling 1212 in all, and they were all of the bacon type. The middle white seems to be the most common hog on the English farm,

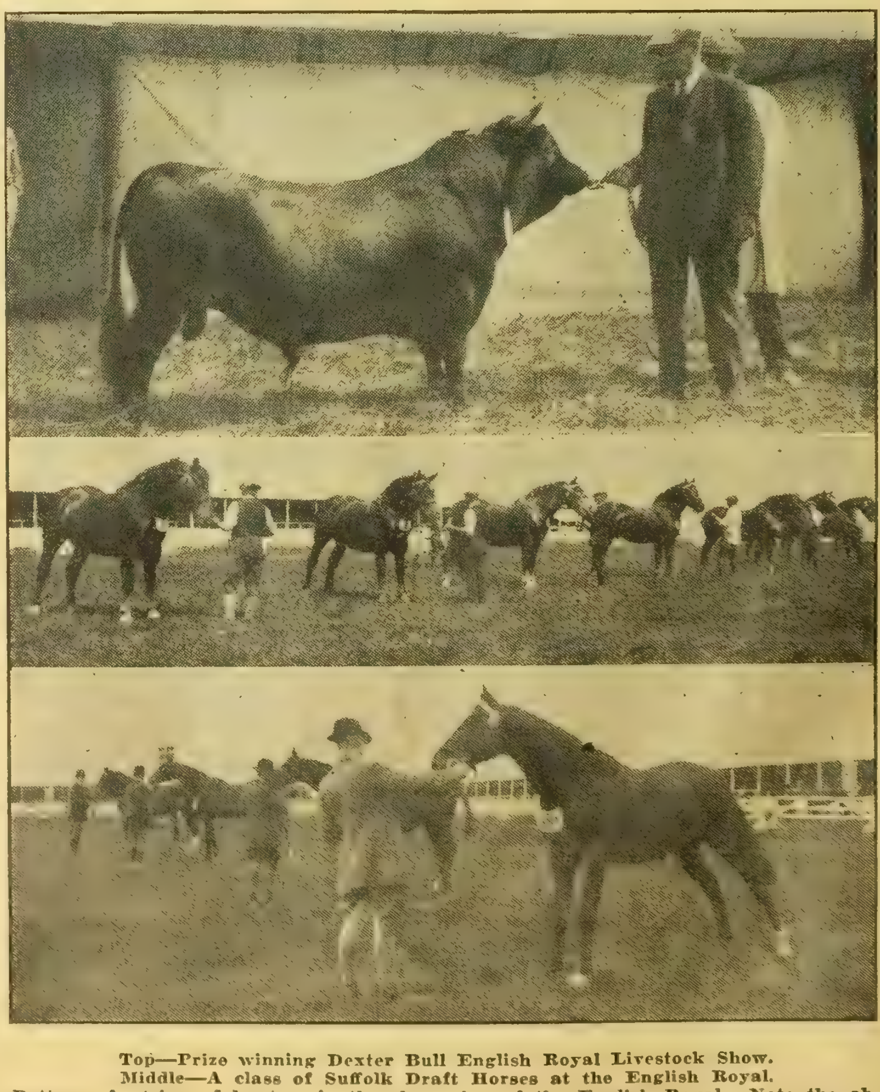
Interest Increasing

It is interesting to note the progress that has been made even in recent years by these pioneers of the livestock industry. When the show was held last in Leicester 28 years ago, there were only eleven breeds of horses shown, eleven of cattle and fifteen of sheep. Since that time then, there have been six more breeds of horses, ten of cattle and twelve of sheep added which have evidently been developed to a showing stage since that time and each one is designed to fill a particular, definite place in that fine art of English livestock culture. If the Englishman wants a cow or a horse or a sheep that will fit in with his local scheme of things and be exactly suited to the possibilities and vicissitudes of his own Shire he gets to work and develops it. They have learned that it is almost as easy to design livestock and make them to order as it is machinery.

Thus it is that the British Isles and mainly England alone, originated all but four of the seventeen breeds of horses entered at the livestock show. All but four of the twenty-one breeds of cattle came from England or Scotland and of the twenty-seven breeds of sheep shown in Leicester all but two originated right in England.

The great show itself quite apart from the livestock end of it deserves mention and commendation in several instances. Every member of our party declared that the horticultural exhibit was the best they had ever seen. The English garden, front and back, is a sacred institution and the best of it's products were most effectively displayed. The strawberries were delicious in spite of their enormous size and the display of flowers of every variety was most ingeniously and elaborately arranged.

There was no midway! Raising and showing livestock is one thing with the Englishman and he takes it as an art, seriously; and a howling carnival is quite another. The British plunges into each so thoroughly that he can't take them both at once without seriously slighting one—and he would never slight either. He will not profane his Hunters and Hackneys by throwing them in with some wonders of the world. A Suffolk sheep. is one thing and a no chance machine is another. The whole atmosphere suggests the intelligent dignity and the solid thoroughness upon which England's greatness in the livestock industry has stood and will stand where others fail.



Top—Prize winning Dexter Bull English Royal Livestock Show.
Middle—A class of Suffolk Draft Horses at the English Royal.
Bottom—A string of hunters in the show ring of the English Royal. Note the absence of spectators in the ring. The rules of the show prohibit people in the ring.

FAMOUS COW DONATED FOR SCIENTIFIC STUDY

Sentiment prevented the famous cow, Sophie Nineteenth, of Hood farm, from falling into unfeeling hands when the herd of which she was a member was dispersed a year ago in April. Her owner, Mrs. C. I. Hood of Lowell, Mass., preferred instead to let this world's champion Jersey cow continue to add to the world's good through her contribution to scientific research, and, accordingly, donated her to the United States Department of Agriculture. Her career as an active producer of dairy products had ceased.

She arrived at the department experimental farm on May 13; and on June 19 she was chloroformed and prepared for study. Outward measurements were made of her body while she was still alive; and afterward the size and weight of her various internal organs were secured. Her wonderful record in production of milk and butterfat over so long a period of time makes the data secured from her an especially valuable contribution to the study that is being made by the Bureau of Dairying of the relation between conformation of dairy cattle and their producing ability. Her skeleton will be prepared and mounted by an expert from the Smithsonian Institution.

Sophie Nineteenth held the world's record for butterfat production in the Jersey breed from January, 1914, to November, 1918, with a production of 17,557 pounds of milk and 999 pounds of butterfat in a year. During 11 lactation periods she produced over 7,500 pounds of butterfat. This is the long-time production record for all breeds.

PICTURES FROM FAR AND NEAR

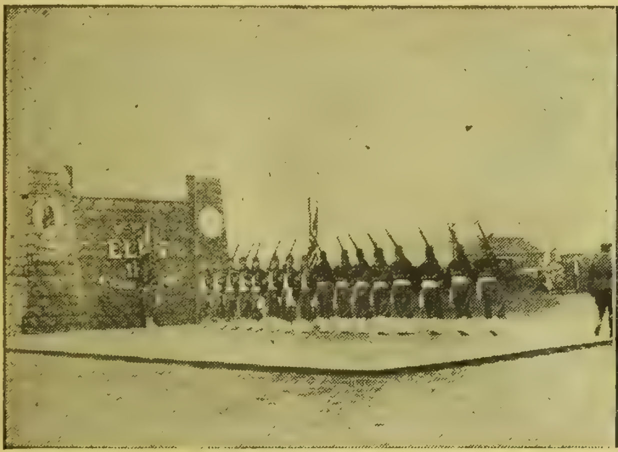
THE FARM PRESS AT SEA.—You may have suspected it before, but here is the actual proof. This picture shows the Agricultural Editors' Association aboard the U. S. S. "Leviathan" sailing for Europe last June. Evidently our own publisher, Mr. Slocum, is taking no chances, as he is the one at the extreme right in the picture, leaning on the rail. Mrs. Slocum is the lady standing beside him.

IN FAR OFF BURMA.—Here is a peaceful scene far from the maddening crowds, on a peaceful river in Burma. The boat in this picture is a house boat and is waiting while an agricultural explorer of the United States Department of Agriculture is away on a trip into the hills of the surrounding country, where he is making researches primarily of interest and value to American agriculture.

CUTS DEATH RATE.—Dr. Deets Pickett, research secretary of the World Service Commission, proves prohibition has cut death rate from alcoholism 50 per cent.

A WALKER OF THE WORLD.—John Caves, of Boston, is the only survivor of eighteen who started to walk four times around the world five years ago. He claims he inherits his walking ability from his uncle, Edward Payson Weston.

COUNSEL ON MARRIAGE QUESTIONS.—Miss Joanna C. Colcord, of the Am. Ass'n. for Organizing Family Social Work, believes in advice on marriage.



FINEST CIVILIAN SOLDIERS.—The Withington Zouaves drill team of Jackson, Mich., giving exhibition at the Elks convention at Boston. They are finest body of civilian soldiers in the United States.

NEW USE FOR VACUUM CLEANER.—S. S. Smith, of Cincinnati, Ohio, uses his vacuum sweeper to get rid of the potato bugs in his garden.

GREATEST SUBMARINE.—This U. S. submarine, shown here in the act of being launched, is the greatest in the world. It will cross the Atlantic and return with one filling of fuel and supplies

A FAMOUS RACE HORSE.—This picture shows Epinard, the famous French race horse, with his trainer at Belmont Park Stables, New York City. He will compete against America's greatest race horses.

"WHITE" INDIANS.—These three San Blas "White" Indian children can hardly be distinguished from the white race. They are Panamanian Indians.

FAMOUS ENGLISH RELIC.—This famous relic of old English days, which is falling to ruin, is Wolf Hall, where King Henry VIII was married to Jane Seymour, while his wife was being beheaded at Windsor Castle.

(Copyright, Keystone View Co.)

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

PARENTS NOT LIABLE

I come to you for advice on a contagious case (diphtheria). The young couple are minors, although married. I understand he is working out by the month. The doctor says he must pay $5 for each call, making 12 trips $60 in all. If he does not pay doctor says the parents of this man must pay for the treatments. Can the doctor make the parents pay this bill? If so what are the regular charges for a doctor in city and out of city per mile. The couple has been shut up for 9 weeks and no other special attention has been paid to them while under quarantine. Could you please furnish particulars to us in this case. I thank you for kindness shown to me.—A Subscriber, Millington, Mich.

UNDER the circumstances, I am of the opinion the parents of the man would not be liable for the payment of his doctor bills. That family relationship, which charges the father with the support of his minor child and entitles him to its earnings, ceases to exist upon the marriage of the child, when he takes upon himself the responsibility not only of supporting himself but a family of his own as well.—Asst. Legal Editor.

HAVE ADMINISTRATOR APPOINTED

I would like to know whether I could do anything about this matter: My father died some time ago and had 120 acres of land and personal property. Mother died last November and last January 1924 father sold the farm to my brother, all the money was paid but two thousand dollars and father took mortgage for the two thousand dollars and he was supposed to hold the mortgage until it was paid. The mortgage is supposed to be paid in five years time. Will you please tell me what I can do about this matter? It is now in a bank in safe keeping; that is where father put it. Does this have to be probated, if it has will you please tell all about how to have it probated? When the mortgage was drawn up it was agreed that there was to be paid $140 a year. How would that money have to be divided up, and who would hold this mortgage until it is paid? Could my brother draw any wages for staying at home? He is now 25 years old and has stayed at home for five years. Would the law permit him to draw any salary? L. M., Michigan.

YOU should make application to the probate court to have an administrator appointed to settle the estate. The mortgage could be held by the administrator or a trustee until the debt is paid, or it could be sold and the proceeds divided among the heirs. The brother could not collect wages unless there was some agreement, expressed or implied, to that effect.—Asst. Legal Editor.

TIME TO FORECLOSE

What is the shortest length of time to foreclose a land mortgage when taken through the Court of Chancery? Could holder of mortgage take this year's crops? Under what conditions may a farmer go into bankruptcy, husband and wife owning property jointly?—A Reader, Ogemau County, Michigan.

THE land could not be sold under chancery foreclosure until 6 months after the decree. The purchaser acquires title to the growing crops on the land at the time of the sale. A farmer may go into bankruptcy if his assets are not sufficient to pay his debts, by filing petition with the referee in bankruptcy. This would not affect household goods.—Asst. Legal Editor.

KILL OUT DAISIES

Would you please tell me how to kill white field daisies? I have a field with a lot of them in. And could you tell me where to write to find the name of a mineral I found while digging post holes and would like to find out what it is.—E. C. Q., Lachrine, Mich.

IF the fields are badly infested with the white daisy (Ox-eye daisy) they should be plowed up and put into a short rotation of crops for a number of years. The plowing and cultivating that will be given these weeds during the period of rotation will kill them out. Scattered weeds will be killed by cutting them off and then salting them, which will lead stock to eat the plants as they send up new leaves. Where there are but a few it is desirable to hoe them out. Under no circumstances should they be allowed to go to seed, as they are among the noxious weeds specified in the state law which must be prevented from seeding.

The mineral found in digging post holes might well be marl. Send a sample of it to the Soils Department of the Michigan Agricultural College, giving the details as to where it was found, etc.—E. A. Bessey, Professor of Botany, Mich. Agricultural College.

HAVE CAUSE FOR ACTION TO RECOVER MONEY

It seems when we farmers get skinned or otherwise badly used we just naturally turn to the M. B. F. to help us out, and I think it a good thing that we can. I am enclosing a stock breeding certificate that was given to me March 1st, 1922, with the understanding that I was to have the service of this bull for 3 years. Shortly afterward I drove my cow over to where this bull was kept and was refused the service and still am refused the service. You will notice by the enclosed note that I paid for the 3 years about a year ago but still can not get the service. Is there any way I can get a return of this money?—M. C. B., North Star, Michigan.

IF you had an agreement by the terms of which you were to have the services of the bull for three years, and these services were refused you, you have a perfectly good cause of action to recover the amount you paid under the agreement.—Asst. Legal Editor.

WHO IS LIABLE FOR TAXES

A accepted a school office, claiming that he was the owner of land bought on a land contract and on that ground could hold office. Though he has claimed to own this land for six years there is no record of transfer in our county office. Who is guilty of dodging the taxes, A who bought the land or B who sold the land? — Reader, Greenville, Mich.

WHO is liable for the tax on land sold under a contract, the vendee or the vendor? The vendor would be primarily liable for the tax, unless the contract discloses that the vendee is to pay it.—Clare Retan, Deputy Attorney General.

SUPERINTENDENT CAN CONDEMN SCHOOL BUILDINGS

We have a one-room schoolhouse in our district built in about 1900 and has been a standard school with from 45 to 70 children attending. Last July at School meeting a few wanted a two-room school, but it was voted down, so during last term two or three men came to inspect, claiming they were state men, and said they would condemn the school and make the district build according to their plan. Please tell me, is there a law that can make us build a two-room school if it is voted down in the district? Taxed are too high now.—F. D., Saginaw, Mich.

ACT 17 of the Public Acts of 1915 as amended by Act 139 of the Public Acts of 1919, gives the Superintendent of Public Instruction the authority to condemn school buildings. Under this act, all plans and specifications for school buildings in Michigan must be approved by the Superintendent of Public Instruction.

If this school has the number of children mentioned in the letter, the people should provide for a two-room school because no teacher can render best services for the community under such conditions. —W. L. Coffey, Deputy Superintendent of Public Instruction.

GOING TO BUILD MANURE PIT

How large a manure pit would it take to store the manure from 24 head of stock, 18 cows and yearlings and six horses? What is the estimated cost of this pit, including a good roof over the same? Would the value of this manure so stored in a good pit be enough to barrow the money and pay seven per cent interest and about four per cent taxes, (because it will be taxed at its full valuation) and allowing for the depreciation? The manure would be stored about six or seven months from all of this stock.—L. S., Sears, Mich.

THE size of the manure pit that would be required would depend upon the amount of bedding that was used in the stable. A pit 18 by 24 feet with manure piled 6 feet deep should be large enough, or a pit 20 by 30 feet with manure piled 4½ would be a good size.

I would estimate that the cost of a concrete pit with wooden posts and roof and three ply roofing would cost from $500 to $600. It is impossible however to accurately estimate the cost of a building in any given community, as the cost of material and labor would differ greatly and the efficiency of the builder would vary greatly.

The value of the manure is estmated as follows: 6 horses @ $25 a year, $150.00; 18 cows @ $20 per head, $360.00; Total, $510.00.

The loss in value of manure when piled out of doors is variously estimated from 45 to 60 per cent. The amount of loss will depend upon the shape and size of the manure pile and upon the amount of rain during the time the manure is stored.

In the vicinity of Sears where manure would be frozen possibly for several months, the losses would be less.

For the purpose of calculation, we will use 50 per cent as the average loss. There will, of course, be some loss in manure when put in a pit. This is estimated from 10 to 20 per cent. For the purpose of calculation we will use 15 per cent.

50 per cent of $510	$255.00
15 per cent of $510	76.50
difference	$178.50

saving in favor of the pit.

The cost of the manure pit per year is estimated in the following table:

Interest on $600 @ 7%	$42
Taxes on $600 @ 4%	24
Depreciation on building 5%	30
Total............	$96

Perhaps the best way to handle barnyard manure is to haul it to the field each day or every other day as it is made. This method, where it can be used, not only saves the value of the manure, but furnishes exercise for the horses and distributes the farm labor. This method can not, of course, be used on land that is so rolling that manure would be likely to wash away. —F. E. Fogle, Assistant Professor, Agricultural Engineering Dep't., M. A. C.

State Fair Ready for Banner Year

THE stage is all set in Detroit for the opening of the Seventy-Fifth Annual Michigan State Fair Friday and from the exhibits in place and the entries on the grounds it is a safe bet that when it closes the night of September 7 this year's fair will go into history as the greatest of them all.

More contests are on for every prize than ever before, the contests promise to be closer, new machinery is in place for its first showing, a mighty educational program is ready and against this constructive side of the fair the entertainers are on the ground for the most elaborate program ever offered at a fair.

State's Progress Shown

One big thing this fair will show thousands of people is already evident before it opens and that is that Michigan is making trembendous strides in agriculture and particularly in the raising of blooded stock. Exhibits now in place and stock in their stalls in the great new cattle palace overshadow anything of other years.

The "million dollar parade" of livestock, which begins Monday evening, September 1 and continues through Friday, will be little short of a revelation to those who began pushing blooded stock in Michigan a comparatively few years ago.

More than $100,000 in cash prizes will be awarded in this fair and judges already on the grounds say competition will be keener in every classification in all departments this year than it has at any time in their experience.

New Buildings Opened

The $500,000 new buildings, the finest fair buildings in America, are being thrown open for this exposition and without them the fair hardly could have been housed. Three miles of pavement in the fair grounds are making easier the travel between the great buildings.

The active educational program, aside from the education a visitor can get walking through the exhibits, includes more intensive work for the boys in the Boys' State Fair school, in a tent city on the grounds, lecturers in every department representing both state and nation and experts in charge of new machinery that manufacturers are showing for the first time.

The entertainment program for the fair balances the serious side and represents an outlay of money undreamed of a few years ago and not in the sense of excessive costs but in the quantity of fun talent obtained.

One of the big features of the fair will be the presentation of "Hiawatha" by a company of full blooded Indians from the Garden River reservation. There are more than fifty of them and they are quartered on the grounds in a regular Indian village.

Big Thrill for Young

The play will be presented every day and leading educational authorities say that it will be one of the greatest single things ever done for Michigan children and that they will carry back home a lifelong impression from seeing Longfellow's famous poem enacted by the very people he wrote about. Thrilling music will add the last touch of realism.

Two of the finest fireworks spectacles ever produced have been made for this fair. The first is "The Founding of Detroit" and the second is "Tokyo." The first will be given Friday, Saturday, and Sunday evening and beginning Monday evening, September 1, "Tokyo" will finish a big program of fireworks.

The "Founding of Detroit" will show in lines of fire against the inky sky the history of old Fort Ponchartrain, the battle between the French and English and Indians for the control of that point of advantage where three Detroit skyscrapers now rear their marble heads above one of the greatest cities of the world. It is a special picture for Michigan, interesting and entertaining.

The other big picture in fireworks is a brilliant record of the disaster that struck Japan in 1923. It shows Tokyo in flames, its buildings toppling and its inhabitants running wildly here and there, bewildered and then in a panic to escape what followed the quake.

This picture in fire, high over the race track, will amaze its watchers in the big new grandstand by its detail and accuracy. Many actual photographs of the Japan disaster were used in its making.

Automobile races daily, aeroplane rides for those who have the nerve, a great cowboy carnival of fancy riders and bull-doggers, Austrailian axe men who cut through a tree quicker than any one else ever has, and the carnival features on the Midway are a few of the things that will keep the fair visitors thrilled, laughing and wondering what there can be left to see.

THE TWO OUTLOOKS ON LIFE

A SERMON BY REV. DAVID F. WARNER

TEXT: "Enter you in at the straight gate: for wide is the gate and broad is the way, that leadeth to destruction, and many are they that enter in thereby. For narrow is the gate and straightened the way, that leadeth unto life, and few are they that find it."—Matthew 7:13, 14.

YESTERDAY we dedicated our remodeled church-house. The Narrow way of living chosen by our folks demanded more room. Rather paradoxical, isn't it, that narrowness should make for more room? But it does, and so we had to build larger. Dr. C. C. Ellis, Christian educator and preacher, splendidly emphasized the need of the Sanctuary of God to interpret aright the things of life. Yes, it was a bit narrow in view-point; but then, that other and Matchless Preacher, many years ago in that great consecration address on the New Sanai, gave us the warrant for the narrow life. He said that the narrowness of faith and obedience leads to life; and the breadth of unfaith and disobedience leads to death. Do you believe it? How emphatic this is made in the two outlooks of our text, which is found in the conclusion of the Sermon on the Mount.

Here are the two gates. Look at them. One is very narrow; the other is broad. One is diffcult to enter; the other easy. But we are entereated to enter the narrow, the straightened gate. We are asked to do the difficult thing. We can be sure that our Savior meant to forewarn us that we might be forearmed. Some years ago, the writer with a company of friends, climbed one of the high sand dunes along Lake Michigan's shores. With the aid of shrubs, we crawled up with effort. But the summit view was sublime. There are difficulties in the narrow way, but the end is glorious.

Now, how shall we enter? The introduction to this mountain discourse, would have us enter by way of the Beattitudes. Is that gate narrow? Listen, "Blessed are the poor in spirit." "Blessed are they that mourn." Yes, you know them. Well, these are the steps in the celestial stairway. And like the laws of health, we suffer if we omit even one of them. Rather restricted, you say. But they lead us high upward to the tablelands of the Kingdom. Yet, it is this confession of one's emptiness and need that the world calls too narrow. And why does this narrow gate make it hard for the rich man to get thru? But why is it hard for the camel to get thru the needle's eye? He is bulked out with the traffic of earth. The selfish richman would vulgarize heaven by carrying along the world's junk. But the narrow gate sloughs off all our reputation, self-confidence, dignities and honors. Christ must find us "meek and lowly," naked and helpless. Alone and unclothed with the habiliments of earth, we came into this world. So, shall we enter the next. But the point of the text is, that while citizens of this world, the King's highway is narrow. A throughful reading of Christ's great sermon will convince the simple and unselfish in mind.

But it is easier to enter the broad gate. Of course. This requires no serious effort, no lofty decision, no long purpose in life. This broad, easy gate is catching all the indifferent, all the selfrighteous, and all the filth and scum of humanity. Attention! If you are not a Christain, you are in the broad and downward drift. And if you are but a negative, lazy, disobedient, and unsocial church-member, you are also there. Take your worldliness in possessions and longings and set out if you will, you will find no narrow jambways to catch on to your earthly accretions. But to enter is to go the way to destruction.

Yet, the narrow gate is also wide. It admits of no sin, but it does admit sinners. Sinners, high and low, rich and poor, cultured and uncultured, when they permit their pride and worldliness to be torn off by its narrow confines. You see, a gate that admits all peoples and classes, is socially and racially wide, as wide as the oceans and the poles. What hope for a lost world!

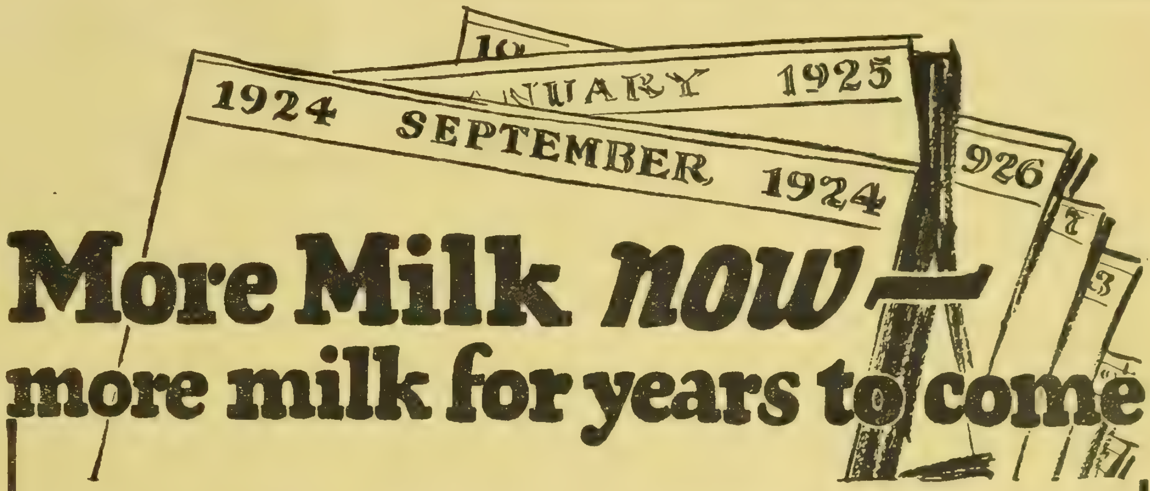
And here are the two ways. One way is "straightened." Have you found it so, Christain friend? So did Israel when going thru the Red Sea gate. Then, there was a wilderness thru which to travel; but there is yet, and so we go on as pilgrims and strangers. But, now as then, God builds the highway. This is narrow, because it is the highway of holiness, and definitely set apart to spiritual purposes and social aims. This is the way that St. Paul discovered when he said, "This one thing I do," and "Whatsoever you do in word or in deed, do all in the name of the Lord Jesus." This scribe used to teach public school in Michigan. The incident is fresh in mind. We are singing. And there comes Mary Sanders up to my desk. Now, what does Mary want? But soon she was making this pious request, "Mr. Warner, may I be excused from singing this song?" "You may." But afterward I said to Mary, "And why did you ask such a thing?" She answered quietly, "I can not sing that song in the name of the Lord Jesus."

And Mary Sanders became the wife of a minister. How fitting! I wonder if she is yet as sensitive about that narrow way as in the unspoiled years of her youth. Now, this "one thing I do" purpose in life, after Pauline fashion, constitutes the narrow way. It does not spread itself to the wide tracts of desert land on either side where the crowd is wandering, aimless and helpless. Yet, how roomy is this way to the Christain! The Bay of Fundy is narrow. There the ocean tide rises high, and boats on its bosom may be lifted far inland to a safe resting place. The tide of God's ocean of love in this narrow way, lifts us up and bears us out into the freedom and rest of his spirit. This is life.

I know our text says there are few on the way. And the proportion yet, I believe, is as the few are to the many. But you will not be lonesome. The Revelator climbs the Mount of Inspiration and sees one hundred forty-four thousand; farther up and he cries out, "ten thousand times ten thousand"; and when he reaches the summit he exclaims, "Behold, a great multitude which no man can number." Now come on, with such companionship and Jesus your heart will burn within you.

But, what of the "broad" way? Well, it is the way of "do as you please." There are no barriers. It is the way in which the serpent found Eve. And there are yet plenty of refreshment stands, gaiety parlors, and retreats of lust. Go that way if you want to. It is easy and attracts and pleases. But after it has fast hold of you, it ceases to have attraction. Many a person has plunged into sin thinking to quit

(Continued on Page 21)



Too many dairymen judge a dairy feed only by the immediate results produced in the milk pail. It is just as important for you to know what the long time results will be.

Right from the start LARRO lays a sure foundation for consistent heavy milk production by first building up the health and condition of your cows. Continuous feeding of LARRO *maintains* health and condition, thus guaranteeing peak milk production, not only now, but month after month, year in and year out.

Actual figures prove this true in thousands of cases—among grade cows and thoroughbreds alike, regardless of breed, regardless of geography.

Cow No. 241 is an ordinary barn Holstein bought by the Larro Research Farm in 1922 for $125. She had been milking 150 days when she arrived at the farm. Her production during the first 30 days thereafter was 724.5 pounds of milk. In her next lactation, during the corresponding 30 day period, she produced 1,173.3 pounds of milk—more than 50% increase. Her total milk production in the first full lactation period at the Larro Research Farm was 13,646.4 pounds—more than three times the average for all cows in the United States. Larro—maintaining health and condition—plus proper care, did it.

Prince's Rose of Meadowbrook is a Jersey who broke the Pennsylvania state record for 2-year-olds in 1922 with 9,810 pounds of milk and 462.79 pounds fat. In 1923 she again became state champion with a record of 14,292 pounds and 639.05 pounds fat. As a calf she was started on a Larro grain ration and kept continuously on Larro throughout the milking periods mentioned.

Down in Florida, Ferndell, of the famous Lemon City White Belted Herd, produced 13,477.9 pounds of milk and 585.64 pounds of butter fat in her twelfth year—five or six years past the age of peak production for most cows. The herd she leads has been fed Larro for thirteen years and averages 9,998 pounds per year.

A feed that accomplishes such long distance results must be a feed that first builds health and condition—then positively maintains these two important requirements for profitable milk production.

Your cows should be on a grain ration now. There is no feed that will more surely guarantee future production and future profits than Larro.

Tons of Beets Are Wasted

This waste is due, for the most part, to faulty methods of harvesting.

You can get all the beets, and get them with the least amount of damage — easily and quickly — with the

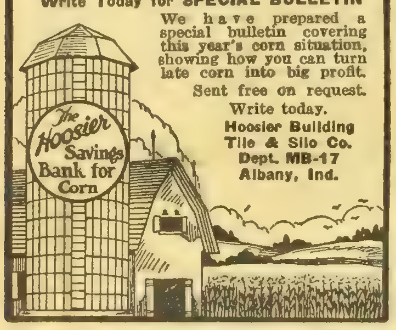
JOHN DEERE
Riding Beet Lifter

Blades of special design loosen the soil and gently lift the beets so they can be easily picked by the hired help.

The roots are not jerked out and left on the ground to dry out and lose their value in sugar content. You can secure the highest prices for beets harvested with the John Deere Beet Lifter.

FREE BOOKLET. Write today for literature on this wonderful tool. Address John Deere, Moline, Ill., and ask for Booklet EJ-733

JOHN DEERE
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS



The Hoosier Savings Bank for Corn

Save Soft Corn in Hoosier Silos

Turn your late soft corn crop into a big money-maker by saving it in a HOOSIER SILO for winter feeding. Prompt shipments certain. Your order placed now insures delivery by the time corn is ready. HOOSIER SILOS in Oregon fir or glazed vitrified tile. Best materials and construction on the market.

Write Today for SPECIAL BULLETIN

We have prepared a special bulletin covering this year's corn situation, showing how you can turn late corn into big profit.

Sent free on request.

Free to Asthma and Hay Fever Sufferers

Free Trial of Method That Anyone Can Use Without Discomfort or Loss of Time.

We have a method for the control of Asthma, and we want you to try it at our expense. No matter whether your case is of long standing or recent development, whether it is present as Chronic Asthma or Hay Fever, you should send for a free trial of our method. No matter in what climate you live, no matter what your age or occupation, if you are troubled with Asthma or Hay Fever, our method should relieve you promptly.

We especially want to send it to those apparently hopeless cases, where all forms of inhalers, douches, opium preparations, fumes, "patent smokes," etc., have failed. We want to show everyone at our expense, that our method is designed to end all difficult breathing, all wheezing, and all those terrible paroxysms.

This free offer is too important to neglect a single day. Write now and begin the method at once. Send no money. Simply mail coupon below. Do it Today —you even do not pay postage.

WHEN WRITING TO ADVERTISERS PLEASE MENTION THE MICHIGAN BUSINESS FARMER

What the Neighbors Say

CANNOT EXPOSE GROUP

DEAR Editor:—In the July 19th issue Mr. M. S. Dowes writes, "I would like to exchange ideas with other farmers." If this could be done the farmers problems could be solved and be solved right. Mr. Dowes or any other farmer is headed in for a hard jolt when he attempts to expose the group that is sticking up the farmers and the system by which they pull their stunt through any publication that is a patron of the organized "news agencies." If they succeed they are more fortunate than I. What have they done? I will leave that matter for you to decide. Stuff they will print but to expose the pirates, strip of the "Sheeps clothing," one's "Manuscript" is junked. That which the farmer needs most right now is, the cooperation of an uncontrolable farm paper. One that recognizes its subscribers as the bases of its success. To which none is "yellow backs ringed streaked or speckled." —J. C., Shelby, Mich.

DOESN'T LIKE SECURITIES COMMISSION

DEAR EDITOR:—I see in your July 19th issue an article by Mr. Powell and your editorial in which you give the Michigan Securities law a great boost. But how about the Commission? It seems so strange in face of all the facts. The generally accepted estimate that 90 per cent of the companies organized for the sale of stock fail within 3 years and that 90 per cent of the investors in this stock lose money, as reported by Mr. Powell, is true in Michigan.

I have never bought any stock nor lost any money in this way, but many of my neighbors have, and I cannot see that the securities commission has offered any protection at all. In fact the losses seem to be greater because the people depend on the commission for protection.

And I have never known a stock or bond salesman to offer anything to us folks in the country that I thought was good. I have been approached many times but nothing has ever been offered to me that I would have approved if I had been a member of the securities commission. In my opinion, as an observer, the biggest fake in the securities business is the Securities commission.

There is a man now operating in eastern Michigan who first, for several years, sold stocks which were a loss to the investors. He is now selling bonds, and effects the sale by having one of the local banks pretend to have bought the bond by placing their "C D" on the bond. When the bond is sold to a real purchaser and paid for, with accrued interest, the accrued interest is paid over to the bank. That is the banks reward for okehing the bond. The bank does not purchase the bond or pay one cent on it. The salesman told me this himself and appeared to see nothing wrong in it.

The securities commission looks like the big factor in assisting the fakes in getting money from half-baked suckers who want to get some "Easy Money," and some "big interest." — J. B., Columbiaville, Mich.

THE IMPORTANT DUTY OF THE ELECTORATE

EDITOR BUSINESS FARMER:—The time is not far distant when the voters of Michigan will be called upon to select Candidates to fill important positions in the state government and, to do this duty wisely, will require the possession of knowledge of the qualifications of the various aspirants for official positions.

It is much to be regretted that a portion of those having the right to vote recognize, so little, their duty in this important matter, indeed, some even take credit to themselves because of not "meddling in politics," and the neglecting of this duty, by many citizens is much to be regretted.

Let us fully inform ourselves regarding candidates, then do our duty as good citizens in this important matter.—Sincerely, J. T. Daniels, Clinton County.

BURDEN TOO HEAVY FOR FARMER

DEAR EDITOR:—Will you allow for a few thoughts about the present expression of Agriculture, and the attitude, thoughtful farmers should take in regard to it?

During the war we produced foodstuffs to our greatest possible capacity, not only for our own army, but for the allied nations as well. This left us with a large supply on hand at the close of the war with a much lessened demand. During the war countries like Australia, New Zealand and other far away agricultural countries, could not market their products on account of the submarine menace and lack of shipping. The close of the war released all this supply for the world market. As a natural consequence, the price went to a very low level. The price of farm products is fixed either directly or indirectly by the world market. This I think is proved by the fact that we are importing agricultural products to a greater value than we are exporting them.

In view of this fact, I can see no prospect of any considerable rise in price. But low prices for what he sells is only one of the farmer's problems. Wages for farm labor are so high as to be almost prohibitive. He must pay for everything he buys at exorbitantly high prices. Taxes are almost if not quite confiscatory. While the close of the war found us with an abundant supply of agricultural products, it was quite different as regards manufactured articles.

Stocks in our stores became depleted, no houses or other buildings were built and at the end of the war, there was a great demand for manufactured products at very high prices. Our war debt was something like 26 billion dollars. We foolishly and extravagantly added to this debt until the total was something like 35 billion dollars. Taxes throughout the country approximate $7,500,000,000, or about $70 for every man, woman and child in the country. These sums are staggering and would be bad if evenly placed, but the fact is the farmer bears a much too large proportion of the burden.

The public official the salaried man and the union worker, all demand increased compensation on account of the high cost of living. Now if these different persons get increased pay so that they can live just as well and easily under this burden of debt, and taxation, then they are not bearing their part.

With the farmer it is quite different, he gets less pay and is bearing more than his share, of the burden. Now as to the farmers' attitude toward these questions: Cooperative marketing, efficiency and good business methods are important at all times, but they don't hit at present fundamental conditions.

At the close of the war Gompers said labor wouldn't stand for any reduction in wages. Now if living costs come down, why shouldn't he work cheaper, as well as the farmer, and help bear the country's burden. The farmer helped put through the highest tariff ever known and was told it would help him out of his difficulties. It has been a failure as far as helping him is concerned but it has mainitained prices for manufactured articles that are almost prohibitive, as far as he is concerned. If the farmer must compete in the world market, why not the manufacturer?

The farmer should demand a reduction of tariff rates to a reasonably low figure. As regards, our public indebtedness, we must bear that burden until it is paid, but we should initiate a policy of "pay as you go" at once and refuse to add to our obligation. There are two phrases to the taxation question. It's excessively big amount and its unequal distribution.

Much of our taxation is caused by inefficiency, extravagance and even dishonesty and graft. Retrenchment all along the line should be the watch word. Too much money is spent foolishly or seemingly just to make jobs.

Soil survey has been an excuse for some fine vacation and many good jobs at the expense of the people. The cases could be multiplied almost indefinitely. The farmer should appoint a committee to be on the job continuously, to go into the matter of public expenditure of money. As regards distribution the proposal gas and income taxes should help.

As regards tax exempt bonds, if we didn't go in debt, the question wouldn't bother us. As regards our National Government, if it wouldn't sell tax exempt bonds in times of great crisis, it might prove very embarrassing and put the government at the mercy of local taxing bodies. As regards inflation of the currency, it requires more money to do the business of the country during a time of intense activity, as during the war period, than in ordinary times.

It is the function of the Federal Reserve System to provide their money as needed.

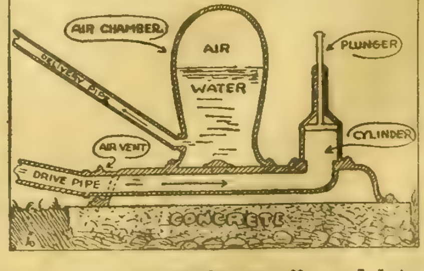
Deflation of the currency to the extent of depressing prices will affect all values and prices alike, and not to the detriment of one industry as at present. Deflation is not the cause of the present plight of the farmer and inflation of the currency would not solve their difficulties, but if carried to any considerable extent, would result disastrously.—K. S. Wood, Charlevoix County.

The Hydraulic Ram on the Farm

THE hydraulic ram is an ancient invention, still new to the minds of many people. It is a simple machine which when installed under a head of water will lift a portion of that water to a heighth much greater than the source.

The machine in simple form conssists of a plunger, a cylinder, a valve and an air or pressure chamber.

The water running from the drive pipe into the cylinder lifts the plunger and when suddenly shut off at the top of stroke recoils and lets the plunger drop back of its own weight. As the plunger reaches the top of its stroke a powerful impact is created which lifts the valve in air chamber and forces some of the water through. The air in the chamber acts as a cushion, making the flow of water from the delivery pipe uniform in volume.



For a small or average size ram one should have a driving flow of 1½ to 8 gallons of water per minute and a fall of 1 foot or more. Unless the water is to be lifted a very great heighth one must not have too much fall else the ram will stop on the up stroke.

For example: A ram working under 18 inches of fall and using 4 gallons of water per minute will lift a barrel of water 40 feet in about 4 hours.

The ram is inexpensive, will last for years and requires no attention when properly installed.

It is well to remember that 3 barrels of water per day will supply a complete bath room and running water in the kitchen for an average sized family.—Fred Ellison.

On our farm we have a spring that flows about 4 gallons of water per minute. It is located about 15 rods from the house and 40 feet lower; and 6 rods from the barn and 12 feed lower. A small ram in this spring furnishes hot and cold water for the kitchen and a complete bathroom. At the barn it pumps the water for 10 cows and 4 horses, and usually there is an overflow. The cost of ram and pipe was about $50. The system is entirely automatic and seldom requires any attention whatever.—Fred Ellison.

RADIO DEPARTMENT

EDITED BY J. HERBERT FERRIS, R. E.

RADIO, EIGHTH WONDER OF WORLD

SELECTING the seven wonders of the world has been a popular pastime the early days of recorded history down to the present.

The ancients got almost as much kick out of choosing them as modern sporting writers do from picking an all-American football team. And they had equally bitter arguments in deciding which objects and phenomena to include and which to eliminate.

The earliest list of the "Seven Wonders of the World" included: The Hanging Gardens of Nebuchadnezzer, the Colossus of Rhodes. Phidias' Statue of Jupiter, the Pyramids, the Temple of Diana at Ephesus, the Tomb of Mausolus and the Palace of Cyrus.

Galloping along down the paths of history the United States got into the Seven Wonders game with such entries as Niagara Falls, the Washington Monument, the Grand Canyon, and the Woolworth Building listed along with foreign sights like the Leaning Tower of Pisa, the Great Wall of China and the Eifel Tower.

But today nobody gets very much excited over the Seven Wonders. The whole world is much more interested in the Eighth Wonder!

By common consent, the title of the Eighth Wonder of the World goes to radio. The marvel of wireless communication has a universal appeal. It amazes, thrills and serves every country and clime.

The effect of this new art and utility cannot even yet be measured or fully forecast. Certain it is that this modern method of communication already is profoundly affecting industry, religion, entertainment, political life, industry and home life everywhere. And the real romance of radio is not alone the spectacular fact of communication through the ether between points thousands of miles apart but the speed and completeness with which the new utility has made a place for itself in the daily life of millions of people.

In fact, the development has been so rapid that the general public has scarcely given a thought to what makes this wonderful source of education and entertainment possible.

What is the essential principle—what really accounts for it?

Amplification is the real explanation. Without amplification, radio of today would be impossible. Charging electric waves to sound waves wouldn't mean much if they couldn't be heard plainly. Amplification builds them up so that they are clear and easy to hear. Amplification is used at the transmitting station as well as at the receiving instrument. Whispers thousonds of miles away become clear, living voices in the homes of millions.

Amplification is multlipication. The small amount of sound energy generated by the voice or an orchestra at the broadcasting station is changed to electrical energy and then multiplied or amplified millions of times. This large amount of energy is then put into an antenna and radiated out into space as an electromagnetic wave. When this wave strikes a similar antenna miles away it gives up to it a small amount of this energy to be amplified again so that a whole roomful of people at the remote point can listen and understand.

Successful amplification is one of the most difficult as well as one of the most important phases of radio production. To amplify is easy, but to amplify so that no distortion or change in the sound is made requires apparatus designed and constructed by specialists in amplification.

In all good amplifiers there are transformers and vacuum tubes. The transformer is the heart of the amplifier. Unless the proper transformer is used the singer's voice in Pittsburg will sound like cat calls in Boston. The voice will be amplified, but the tone and the rich natural quality will not be preserved without a proper transformer.

In a very real and vital sense, the Eighth Wonder of the World depends on amplification, and the next stage of radio's development is the wide ruse of efficient amplification so that quality as well as volume of sound is obtained — amplification without distortion.—Southern Ruralist.

SENDS SET TO BE TESTED

Radio Editor: I notice in THE BUSINESS FARMER, that you offer to adjust radio sets that do not work properly. I built one a short time ago, about two months, that has not worked very well. It is very squeally and noisy, also of late does not bring in many stations. I have a six volt storage battery to light the filament, but perhaps the plate battery is getting weak. I am sending the entire set to you, with the exception of the storage battery, also my check for $6.00. If the plate battery is exhausted, please replace it from this money. I think perhaps that the vario-coupler is not very satisfactory either. I bought a forty-three plate variable condenser, but removed part of the plates, they are in an envelope in the box with the set. If the amount enclosed does not cover expense of fixing and returning the set please let me know and I will send the amount needed immediately. I have been using this set on a single wire aerial, about thirty feet above the ground. Thanking you in advance for this very great favor, I am—O. M. C., St. Johns, Michigan.

YOUR set goes forward to you today by parcel post. Last night I listened to the different stations on your set and they all came in clear and strong, from Omaha, Neb., to Springfield, Mass. In the daytime I got KYW and WWJ fine and clear.

I believe it will give you many months of service from now on. You will notice that I changed some of your connections and have removed the connections from the phone condenser. You will not need to use this condenser as the telephone cords have sufficient capacity in themselves and take the place of the condenser.

Your package arrived in such bad condition that one of the B batteries was all broken to pieces and was unusable. The battery that is left, the ABC battery, is perfectly good yet. You should not use more than 22½ volts on this set or bulb. Do not burn the bulb very bright.

The grid leak was broken and so I replaced that at a cost of 50c; it is a RCA make. The condensers are OK also the vario-coupler which ought to give you lots of service. I would not advise spending any money on a new one unless this one breaks for you. You used acid solder and that is liable to cause trouble. It should never be used on a radio set.

The total cost to you is the postage plus the cost of the grid leak, 50c and leaves you from your $6.00 check, $5.03 which I am enclosing in the form of a check.

KDKA DROWNS OUT OTHER STATIONS

I am sending you my foreign bulb and also my grid leak. When I bought the grid leak, I understood that I had condenser and leak combined but I have made up my mind that it is only the leak, and therefore I wanted you to test these out for me. I tried the bulb out as a plain detector without grid leak or condenser and I have hear KDKA and WGY but not very good. The tube seems to plug up and I had to use the variable condenser in the ground lead instead of the aerial. Would a 43-plate condenser be better on a set with an aerial of 200 feet like mine, than a 23-three plate one? Would it shorten my range to cut the aerial down to 125 feet as I read a shorter aerial gives more selective tuning? If I did so I could have a shorter and more direct lead to my set? Is a C-12 tube as good as a WD-12 tube? Could I use one stage of amplification with my crystal? I do not hear KDKA in the daytime on the crystal. We do hear WABM at Saginaw and also Detroit Stations on some days but every night KDKA comes in, and sometimes so loud as to drown everything else out and no matter how you tune, they are there. Could this be helped? I use a loose coupler with a variable condenser in the detector circuit? We shall be very grateful to you if you can help us and thanking you for your kindness, I am J. M. T., St. Charles, Michigan.

IN today's mail I am returning to you the "Telefunken" bulb and grid resistance. The grid resistance does not have a condenser attached and in itself seems to be broken internally as I could not get it to work with either your tube or with any of my sets. It is defective I believe and should be returned to the store for another one.

The vacuum tube needs nearly 90 volts on it to work as a detector and then it is not at all sensitive and does not compare with the WD-12 tube. As an amplifier it works quite well on 90 volts or more of B battery. I do not think that it will give you satisfaction except as an amplifying tube and then it is not as good as our American tubes.

Yes the C-12 tube is as good as the WD-12 tube, they are exactly the same and made by the same people, under the same patents.

No, a 43 plate condenser would not be as good as a 23 plate one on a long aerial.

You will get much better selectivity, sharper tuning, and better results on the whole if you cut the aerial down to 125 feet instead of 200 feet. The long aerial is one of the reasons that you have trouble in tuning out KDKA on your present set.

"LATE deliveries make dissatisfied customers and high tire costs cut my profits—so I use Red-Tops. They're the only tires I can really depend on to keep my car on the job every hour day in and day out."

The secret of Red-Top's ability to stand more hard knocks than other tires is found in its extra ply and its extra heavy tough red tread. This heavier and stronger construction adds thousands of miles to its life.

Oh Money! Money!

by ELEANOR H. PORTER

(Continued from August 16th issue.)

"WELL, I can; and I'll tell you why. It's put me back where I belong—behind the counter of a grocery store. I've bought out the old stand. Oh, I had enough left for that, and more! Closed the deal last night. Gorry but I was glad to feel the old floor under my feet again!"

"But I thought you—you were tired of work, and—wanted to enjoy yourself," stammered Mr. Smith.

Frank Blaisdell laughed.

"Tired of work—wanted to enjoy myself, indeed! Yes, I know I did say something like that. But, let me tell you this, Mr. Smith. Talk about work!—I never worked so hard in my life as I have the last ten months trying to enjoy myself. How these folks can stand gadding 'round the country week in and week out, feeding their stomachs on a French dictionary instead of good United States meat and potatoes and squash, and spending their days traipsing off to see things they ain't a mite interested in, and their nights trying to get rested so they can go and see more the next day, I don't understand."

Mr. Smith chuckled.

"I'm afraid these touring agencies wouldn't like to have you write their ads for them, Mr. Blaisdell!"

"Well, they hadn't better ask me to," smiled the other grimly. "But that ain't all. Since I come back I've been working even harder trying to enjoy myself here at home—knockin' silly little balls over a ten acre lot in a game a healthy ten-year-old boy would scorn to play."

"But how about your new car? Didn't you enjoy riding in that?" bantered Mr. Smith.

"Oh, yes, I enjoyed the riding well enough; but I didn't enjoy hunting for punctures, putting on new tires, or burrowing into the inside of the critter to find out why she didn't go! And that's what I was doing most of the time. I never did like machinery. It ain't in my line."

He paused a moment, then went on a little wistfully:—

"I suspect, Mr. Smith, there ain't anything in my line but groceries. It's all I know. It's all I ever have known. If—if I had my life to live over again, I'd do different, maybe. I'd see if I couldn't find out what there was in a picture to make folks stand and stare at it an hour at a time when you could see the whole thing in a minute—and it wa'n't worth lookin' at, anyway, even for a minute. And music, too. Now, I like a good tune what is a tune; but them caterwaulings and dirges that that chap Gray plays on that fiddle of his—gorry, Mr. Smith, I'd rather hear the old born door at home squeak any day. But if I was younger I'd try to learn to like 'em. I would! Look at Flora, now. She can set by the hour in front of that phonygraph of hers, and not know it!"

"Yes, I know," smiled Mr. Smith.

"And there's books, too," resumed the other, still wistfully. "I'd read books—if I could stay awake long enough to do it—and I'd find out what there was in 'em to make a good sensible man like Jim Blaisdell daft over 'em—and Maggie Duff, too. Why, that little woman used to go hungry sometimes, when she was a girl, so she could buy a book she wanted. I know she did. Why, I'd'a' given anything this last year if I could 'a' got interested—really interested, readin'. I I could 'a' killed an awful lot of time that way. But I couldn't do it. I bought a lot of 'em, too, an' tried it; but I expect I didn't begin young enough. I tell ye, Mr. Smith, I've about come to the conclusion that there ain't a thing in the world so hard to kill as time. I've tried it, and I know. Why, I got so I couldn't even kill it eatin'—though I 'most killed myself tryin' it! An' let me tell ye another thing. A full stomach ain't in it with bein' hungry an' knowing a good dinner's coming. Why, there was weeks at a time back there that I didn't know the meaning of the word 'hungry.' You'd oughter seen the jolt I give one o'them waiter-chaps one day when he comes up with his paper and pencil and asks me what I wanted. 'Want?' says I. 'There ain't but one thing on this earth I want, and you can't give it to me. I want to want something. I'm tired of bein' so blamed satisfied all the time!' "

"And what did—Alphonso say to that?" chuckled Mr. Smith appreciatively.

"Alphonso? Oh, the waiter-fellow, you mean? Oh, he just stared a minute, then mumbled his usual 'Yes' sir, very good, sir,' and shoved that confounded printed card of his a little nearer to my nose. But, there! I guess you've heard enough of this, Mr. Smith. It's only that I was trying to tell you why I'm actually glad we lost that money. It's give me back my man's job again."

"Good! Alright, then. I won't waste any more sympathy on you," laughed Mr. Smith.

"Well, you needn't. And there's another thing. I hope it'll give me back a little of my old faith in my fellow-man."

"What do you mean by that?"

"Just this. I won't suspect every man, woman, and child that says a civil word to me now of having designs on my pocketbook Why. Mr. Smith, you wouldn't believe it, if I told you, the things that's been done and said to get a little money out of me. Of course, the open gold-brick schemes I know enough to dodge, 'most of 'em (unless you count in that darn Benson minimm stock), and I spotted the blackmailers all right, most generally. But I was flabbergasted when a woman tackled the job and began to make love to me—actually make love to me!—one day when Jane's back was turned. Gorry! Do I look such a fool as that, Mr. Smith? Well, anyhow, there won't be any more of that kind, nor anybody after my money now, I guess," he finished with a sage wag of his head as he turned away.

To Miss Maggie that evening Mr. Smith said, after recounting the earlier portion of the conversation: "So you see you were right, after all. I shall have to own it up. Mr. Frank Blaisdell had plenty to retire upon, but nothing to retire to. But I'm glad—if he's happy now."

"And he isn't the only one that that forty-thousand-dollar loss has done a good turn to," nodded Miss Maggie. "Mellicent has just been here. You know she's home from school. It's the Easter vacation, anyway, but she isn't going back. It's too expensive."

Miss Maggie spoke with studied casualness, but there was an added color in her cheeks—Miss Maggie always flushed when she mentioned Mellicent's name to Mr. Smith, in spite of her indignant efforts not to do so.

"Oh, is that true?"

"Yes. Well, the Pennocks had a dance last night, and Mellicent went. She said she had to laugh to see Mrs. Pennock's efforts to keep Carl away from her—the loss of the money is known everywhere now, and has been greatly exaggerated, I've heard. She said that even Hibbard Gaylord had the air of one trying to let her down easy. Mellicent was immensely amused."

"Where was Donald Gray?"

"Oh, he wasn't there. He doesn't move in the Pennock crowd much. But Mellicent sees him, and—and everything's all right there, now. That's why Mellicent is so happy."

"You mean— Has her mother given in?"

"Yes. You see, Jane was at the dance, too, and she saw Carl, and she saw Hibbard Gaylord. And she was furious. She told Mellicent this morning that she had her opinion of fellows who would show so plainly as Carl Pennock and Hibbard Gaylord did that it was the money they were after."

"I'm afraid—Mrs. Jane has changed her shoes again," murmured Mr. Smith, his eyes merry.

"Has changed—oh!" Miss Maggie's puzzled frown gave way to a laugh. "Well, yes, perhaps the shoe is on the other foot again. But, anyway, she doesn't love Carl or Hibbard any more, and she does love Donald Gray. He hasn't let the loss of the money make any difference to him, you see. He's been even more devoted, if anything. She told Mellicent this morning that he was a very estimable young man, and she liked him very much. Perhaps you see now why Mellicent is—happy."

Good! I'm glad to know it," cried Mr. Smith heartily. "I'm glad—" His face changed suddenly. His eyes grew somber. "I'm glad the loss of the money brought them some happiness—if the possession of it didn't," he finished moodily, turning to go to his own room. At the hall he paused and looked back at Miss Maggie, standing by the table, gazing after him with troubled eyes. "Did Mellicent say—whether Fred was there?" he asked.

"Yes. She said he wasn't there. He didn't come home for this vacation at all. She said she didn't know why. I suspect Mellicent doesn't know anything about that wretched affair of his."

"We'll hope not. So the young gentleman didn't show up at all?"

"No, nor Bessie. She went home with a Long Island girl. Hattie didn't go to the Pennocks' either. Hattie has—has been very different since this affair of Fred's. I think it frightened her terribly—it was so near a tragedy; the boy threatened to kill himself, you know, if his father didn't help him out."

"But his father did help him out!" flared the man irritably.

"Yes, I know he did; and I'm afraid he found things in a pretty bad mess—when he got there," sighed Miss Maggie. "It was a bad mess all around."

"You are exactly right!" ejaculated Mr. Smith with sudden and peculiar emphasis. "It is, indeed, a bad mess all around," he growled as he disappeared through the door.

Behind him, Miss Maggie still stood motionless, looking after him with troubled eyes.

As the spring days grew warmer, Miss Maggie had occasioned many times to look after Mr. Smith with troubled eyes. She could not understand him at all. One day he would be the old delightful companion, genial, cheery, generously donating a box of chocolates to the center-table bonbon dish or a dozen- hot house roses to the mantel vase. The next, he would nervous, abstracted almost irritable. Yet she could see no possible reason for the change.

Sometimes she wondered fearfully if Mellicent could have anything to do with it. Was it possible that he cared for Mellicent, and to see her now so happy with Donald Gray was more than he could bear? It did not seem credible. There was his own statement that he had devoted himself to her solely and only to help keep the undesirable lovers away and give Donald Gray a chance.

Besides, had he not said that he was not a marrying man, anyway? To be sure, that seemed a pity—a man so kind and thoughtful and so delightfully companionable! But then, it was nothing to her, of course—only she did hope he was not feeling unhappy over Mellicent!

Miss Maggie wished, too, that Mr. Smith would not bring flowers and candy so often. It worried her. She felt as if he were spending too much money—and she had got the impression in some way that he did not have any too much money to spend. And there were the expensive motor trips, too—she feared Mr. Smith was extravagant. Yet she could not tell him so, of course. He never seemed to realize the value of a dollar, anyway, and he very obviously did not know how to get the most out of it. Look at his foolish generosity in regard to the board he paid her!

Miss Maggie wondered sometimes if it might not be worry over money matters that was making him so nervous and irritable on occasions now. Plainly he was very near the end of his work there in Hillerton. He was not getting so many letters on Blaisdell matters from away, either. For a month now he had done nothing but a useless repetition of old work; and of late, a good deal of the time, he was not even making that pretense of being busy. For days at a time he would not touch his records. That could mean but one thing, of course; his work was done. Yet he seemed to be making no move toward departure. Not that she wanted him to go. She should miss him very much when he went, of course. But she did not like to feel that he was staying simply because he had nowhere to go and nothing to do. Miss Maggie did not believe in able-bodied men who had nowhere to go and nothing to do—and she wanted very much to believe in Mr. Smith.

She had been under the impression that he was getting the Blaisdell material together for a book, and that he was intending to publish it himself. He had been very happy and interested. Now he was unhappy and uninterested. His book must be ready, but he was making no move to publish it. To Miss Maggie this could mean but one thing: some financial reverses had made it impossible for him to carry out his plans, and had left him stranded with no definite aim for the future.

She was so sorry!—but there seemed to be nothing that she could do. She had tried to help by insisting that he pay less for his board; but he had not only scouted that idea, but had brought her more chocolate and flowers than ever—for all the world as if he had divined her suspicions and wished to disprove them.

That Mr. Smith was trying to keep something from her, Miss Maggie was sure. She was the more sure, perhaps, because she herself had something that she was trying to keep from Mr. Smith—and she thought she recognized the symptoms.

Meanwhile April budded into May, and May blossomed into June; and June brought all the Blaisdells together again in Hillerton.

CHAPTER XXII

With Every Jim a James

Two days after Fred Blaisdell had returned from college, his mother came to see Miss Maggie. Mr. Smith wes rearranging the books on Miss Maggie's shelves and trying to make room for the new ones he had bought her through the winter. When Mrs. Hattie came in, red-eyed and flushed-faced, he ceased his work at once and would have left the room, but she stopped him with a gesture.

"No, don't go. You know all about it, anyway,— and I'd just as soon you knew the rest. So you can keep right to work. I just came down to talk things over with Maggie. I—I'm sure I don't know w-what I'm going to do—when I can't."

"But you always can, dear," soothed Miss Maggie cheerily, handing her visitor a fan and taking a chair near her.

Mr. Smith, after a moment's hesitation, turned quietly back to his bookshelves.

"But I can't," choked Mrs. Hattie. "I—I'm going away."

"Away? Where? What do you mean?" cried Miss Maggie. "Not to—live!"

"Yes. That's what I came to tell you."

"Why, Hattie Blaisdell, where are you going?"

"To Plainville—next month."

"Plainville? Oh, well, cheer up! That's only forty miles from here. I guess we can still see each other. Now, tell me, what does this all mean?"

"Well, of course, it began with Fred—his trouble you know."

"But I thought Jim fixed that all up, dear."

"Oh, he did. He paid the money, and nobody there at college knew a thing about it. But there were—other things. Fred told us some of them night before last. He says he's ashamed of himself, but that he believe's there's enough left in him to make a man of him yet. But he says he can't do it—there."

"You mean—he doesn't want to go back to college?" Miss Maggie's voice showed her disappointment.

"Oh, he wants to go to college—but not there."

"Oh," nodded Miss Maggie. "I see."

"He says he's had too much money to spend—and that 'twouldn't be easy not to spend it—if he was back there, in the old crowd. So he wants to go somewhere else."

"Well, that's all right, isn't it?"

"Y-yes. Jim says it is. He's awfully happy over it, and—and I guess I am."

"Of course you are! But now, what is this about Plainville?"

"Oh that grew out of it—all this. Mr. Hammond is going to open a new office in Plainville and he's offered Jiim—James no, Jim—I'm not going to call him 'James' any more!—the chance to manage it."

"Well, that's fine, I'm sure."

"Yes, of course that part is fine—splendid. He'll get a bigger salary, and all that, and—and I guess I'm glad to go, anyway. I don't like Hillerton any more. I haven't got any friends here, Maggie. Of course, I wouldn't have anything to do with the Gaylords now, after what's happened,—that boy getting my boy to drink and gamble, and—and everything. And yet—you know I've strained every nerve for years, and worked and worked to get where my children could—could be with them!"

"It didn't pay, did it, Hattie?"

"I guess it didn't! They're perfectly horrid—every one of them, and I hate them!"

"Oh, Hattie, Hattie!"

"Well, I do. Look at what they've done to Fred, and Bessie, too! I shan't let her be with them any more, either. There aren't any folks here we can be with now. That's why I don't mind going away. All our friends that we used to know don't like us any more, they're so jealous on account of the money. Oh, yes, I know you think I'm to blame for that," she went on aggrievedly. "I can see you do, by your face. Jim says so, too. And maybe I am. But it was just so I could get ahead. I did so want to be somebody!"

"I know, Hattie." Miss Maggie looked as if she would like to say something more—but she did not say it.

Over at the bookcase Mr. Smith was abstractedly opening and shutting the book in his hand. His gaze was out the window near him. He had not touched the books on the shelves for some time.

"And look at how I've tried and see what it has come to—Bessie so high-headed and airy she makes fun of us, and Fred a gambler and a drunkard, and 'most a thief. And it's all that horrid hundred thousand dollars!"

The books in Mr. Smith's hand slipped to the floor with a bang; but no one was noticing Mr. Smiith.

"Oh, Hattie, don't blame the hundred thousand dollars," cried Miss Maggie.

"Jim says it was, and Fred does, too. They talked awfully. Fred said it was all just the same kind of a way that I'd tried to make folks call Jim 'James.' He said I'd been trying to make every single 'Jim' we had into a 'James,' until I'd taken away all of the fun of living. And I suppose maybe he's right, too." Mrs. Hattie sighed profoundly. "Well' anyhow, I'm not going to do it anymore. There isn't any fun in it, anyway. It doesn't make any difference how hard I tried to get ahead, I always found somebody a little 'aheadier,' as Benny calls it. So what's the use?"

"There isn't any use—in that kind of trying, Hattie."

"No, I suppose there isn't. Jim said I was like the little boy that they asked what would make him the happiest of anything in the world, and he answered, 'Everything that I haven't got.' But I don't see as I'm any worse than other folks. Everybody goes for money; but I'm sure I don't see why—if it doesn't make them any happier than it has me! Well, I must be going." Mrs. Hattie rose wearily. "We shall begin to pack the first of the month. It looks like a moun-

(Continued on page 17.)

DEAR STORY READERS:—Some of you have written to ask if you missed a part of the story between the July 19th and the August 16th issues. You did not! Every word in the book "Oh Money! Money!" will be published in The Business Farmer, we never cut down a story or leave out a word for any reason. This week we are giving you a great big installment and the story will probably finish with our issue of September 27th, and we hope to start a new story, just as good, if not better in that same issue. Don't miss it!—The Editors.

Grant Slocum, Gleaner Founder, Passes On

Pioneer Farm Organizer and Agricultural Leader Dies Following Long Illness

(From The Detroit Free Press, Aug. 15th, 1924.)

GRANT H. SLOCUM
October 12, 1864
August 14, 1924

GRANT H. SLOCUM, who organized the Ancient Order of Gleaners in 1894, and had been head of that order for 30 years, died at his home near Mt. Clemens, as a result of apoplexy suffered May 16. He was 59 years old.

For nearly a third of a century, Grant Slocum had been one of the political leaders among Michigan farmers, and, aided by his organization, was credited with controlling large numbers of votes, but, despite his political strength, he never held office of any kind.

He was born on a farm near Holly, October 12, 1864, where he remained until he was a young man, when he went to Caro, Tuscola county, to learn the printing trade.

Published Tuscola Paper

There he acquired the Tuscola County Courier, which he published for many years. While engaged in this enterprise he conceived the idea of a great fraternal insurance order to be built up among the farmers, and in September, 1894, the Gleaners came into being, with 25 members.

The organization grew until it had 75,000 members, principally in eight middle western states, and 1,400 lodges. In 1909 headquarters was moved to Detroit, and Mr. Slocum came here to live, but 12 years ago he built the home where he died, near Mt. Clemens.

His entire life was devoted to farm enterprises. He organized the Gleaners' Clearing House association, which unified a group of co-operative elevators throughout the state and which was operated successfully for nearly a quarter of a century until the depression following the war sounded its death knell.

Promoted Prison Twine

Through his initiative, during the time in which Nathan F. Simpson was warden of Jackson Prison, the Gleaners purchased the entire output of binder twine, and retailed it to members of the order throughout the state.

He was president of the Peoples State bank of Middleton, which has branches in several neighboring villages, vice-president of the State Savings bank of Caro, and a director of the Commercial bank of Caro. He was a Mason, an Odd Fellow, a Gleaner, a Yeoman, and a Woodman.

Mr. Slocum was married in 1886 to Miss Ada Mertz, of Caro. Two children, Mrs. Ford Gargett, of Ionia, and George M. Slocum, of Mt. Clemens, and James Slocum, a brother, survive.

Funeral services were held at the residence at 2 o'clock Saturday afternoon and the body temporarily placed in a vault at Mt. Clemens.

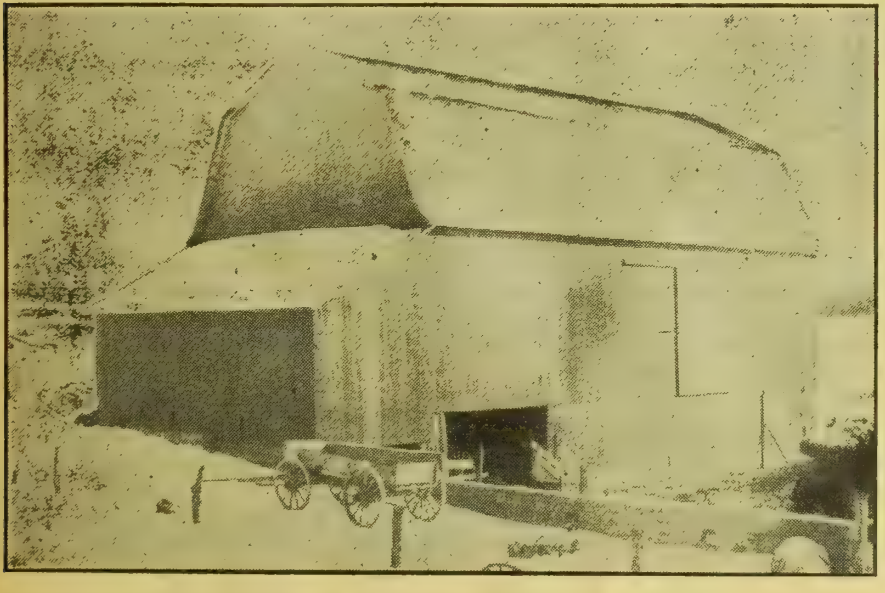
Active pallbearers included R. L. Holoway, J. J. England, John Hudson, F. C. Goodyear, George L. Strachan, Nathan F. Simpson, Herbert F. Baker and H. I. Zimmer, all members of the board of directors of the Gleaners. There were 20 honorary pallbearers.

Floral tributes numbered more than 500 and when the residence became filled with blooms shortly before the services several hundred designs had to be placed in the yard and on the porches.

Note: Mr. George M. Slocum's tribute to the memory of his father appears on the editorial page of this issue.

OUR READERS' NEW BUILDINGS

Have you built any up-to-date farm buildings lately? If you have send us a picture of the new building and we will print it in this new department. It will show the M. B. F. readers what their distant neighbors are doing to change the scenery. And, incidently, you may be able to help some farmer decide the type of house, or barn, or other buildings he desires to put up. He may like the appearance of your building and will want the plan of it. Kodak pictures are all right if the details show up well. Do not send the negative, just a good print.



CHAS. BISSELL OF MARCELLUS BUILDS NEW BARN

This barn, built in 1923, is thirty feet by sixty-seven feet and there is a basement under the entire barn. It stands on the farm of Charles Bissell, Marcellus, Mich., and he writes that the capacity of the basement is twenty head of cattle, six horses, one hundred sheep and forty hogs. The mows will hold seventy tons of hay while the granary inside the barn will hold one thousand bushels of corn and a thousand bushels of wheat. It cost $2600. Let's hear from some of our other readers.

The State Fair

A STATE FAIR is an arena for friendly competition. It is an educational opportunity. It is a medium of exchange for ideas and property. It is a social event. It is a reflection of agricultural optimism. It is an annual census of progressive agriculture. It is a pageant of progress.

The crop and livestock products of a great commonwealth are on display. The best grains, the most nutritious grasses, and the finest farm animals on exhibition give evidence of man's progress in soil husbandry.

Ever keeping pace with the progress of the world's basic industry—agriculture—has been the development of the Nation's arteries of transportation. Interdependent as are agriculture and transportation, it is becoming more and more evident that the prosperity of one depends upon the success of the other.

Always in the lead to recognize the needs of the country, the New York Central Lines have spent millions upon millions of dollars in providing livestock cars, box cars for grain, and refrigerator cars.

When visiting the State Fair, consider also the fact that the progress reflected there is, in a large measure, possible through the foresight and progressiveness of the builders of our great railroad systems.

"The Farm Paper of Service"

—TO "GRANT," MY FATHER

FOR as far back as I can remember, I had called him "Grant," just as did those with whom he worked or played. And when the grandchildren came he would not have the barrier of "grandpa" raised between their little hearts and his big one, and so they were taught at his very knee to call him "Grant" too. Such simple humility of spirit as this expressed, is the key by which to read the memories of this hour. Sympathy welled up in his heart with every pulse-beat and, whether he would or not, it must flow in some direction or burst its bounds.

Thus it is easy to see, from whence came his life's greatest desire; to better the condition of the men and women who tilled the soil. For had not his very fingers picked the endless stone from the fields of his father's farm? Had he not seen his own father, a rugged pioneer of that type who could not know defeat, forced to toil as a carpenter because that same farm could not even barely feed and clothe his family of two girls and four boys, of whom Grant was the youngest?

* * *

It is not strange then, that the farm held small attraction for these children. They had seen its seamy side. So when his turn came, Grant too, left it and followed two older brothers into the country newspaper business, where by diligence and creative ability he soon laid the foundation of a comfortable business career.

But the memory of his mother's struggle and his father's toil on that rocky farm would not be stilled. Grant saw the injustice of it all. The farmers' helpless position haunted him.

Finally the bounds of his sympathy broke and its flood carried before it all the selfish aims and ambitions which otherwise might have marked a life devoted only to personal gain. No Moses or Joan ever dreamed more clearly a vision of leadership out of an intolerable condition for a part of God's children than did Grant Slocum, when from printed page and platform he preached the salvation of the individual farmer through organization and co-operation.

* * *

Only the rugged constitution of a countrybred boy could have endured the struggle of the years after he seen the vision. Country schoolhouses, dimly lit and crowded to suffocation, resounded to his pleading and his battle cry. Long, freezing drives through snow piled high over fences, until the way of the road itself was lost, he made to get back to the home that was his haven of refuge and his shrine of devotion.

But such inspiring labor as was his, soon found reward and others, fired by his enthusiasm, lit their torches from his own and in turn kindled more until thousands of faces were lighted by its glow and countless hearts took courage from its promises.

Grant Slocum was one of the pioneers of farmers' organization and co-operation in America. And he would not, could he speak today, ask any greater reward than that simple appraisement of his lifetime's work.

* * *

That his sympathy should have won countless friends goes without saying. And that some, who knew his personal following and his strength, should have tempted him with the possibilities of public office and the honors of government position, are obvious. But that in an active lifetime he never accepted such honors must bespeak more than mere words could, how unflinchingly he held to the single purpose on which he had marked his goal.

* * *

In later years when the fruits of frugality had made it possible for him to lay down the battle and enjoy the rest which was his reward, how he struggled to do it! Yet the fire of youth's purpose burned within his now worn body, fanned, it seemed, to an even brighter intensity by every report of victory in the emancipation of the farmer.

But while the battle still waged, he who had been one of its generals was carried from the field wounded, and when the passing of hours into days, days into weeks, and weeks into months told him he could never again pick up his beloved banner and carry it forward, he gave up.

His last words, when only power of speech remained, for he had poured out his last ounce of strength, were

"Come on now, boys, all together, over the top!"

And that challenge will remain, engraved in the hearts and burning in the breasts, of the great circle of those who loved him so well and who called him "Grant."—GEORGE M. SLOCUM.

SILVER LINING TOO BRIGHT

IT might have been just as well for the newly organized Grain Marketing Company if Gray Silver, its president, had not painted so rosy a picture of its future when he talked to the agricultural editors, who accepted the invitation sent out by that company to "come to Chicago at our expense."

Altho we were not in attendance, we understand that among other things, Mr. Silver, in the style which has already won him some fame, stated:

> "It is estimated—and the estimate is conservative—that a saving of five cents per bushel will be effected in the cost of handling grain from the time it leaves the farm granary until it reaches the mill or the manufacturer. Applied to the whole wheat crop, this would reach the enormous total of $40,000,000 a year. Applied to the volume of corn moving through commercial channels, it would be approximately as much, with the other grain contributing to the grand total applied to the wheat and corn leaving the farm, certainly $70,000,000 would be conservative. The entire capitalization of the Grain Marketing Co. is $26,000,000. In other words, if about one-third of the savings which it is estimated can be made for the farmer on the cost of handling his wheat and corn surpluses during a single year could be so employed, the capitalization could be obtained and a tidy little sum could be saved. If a considerably lesser proportion could be employed to pay for the properties that have been leased, the farmers would quickly be in complete ownership of all the elevators and other machinery comprised in those properties."

Of course, we could not have swallowed so large a lump without choking and we certainly do not expect our readers to. Promoters are not allowed under the "blue-sky" laws of Michigan to burn so much gas when they are talking to their prospect about the purchase of stock, but perhaps Mr. Silver knew well enough that none of the farm paper editors present would buy anyway, so he might as well go the limit, and apparently he did!

In our last issue, on this page, we had something to say about this $26,000,000 proposition which is to be sold to the farmers of America. Now, as we read over what we wrote two weeks ago, it sounds very mild indeed. We said we were charitable towards any farmers cooperative movement and we are. We can overlook mistakes, when honest effort prompted them, but we cannot and will not stand for anything which appears to us a misrepresentation of facts.

Too many honest men with honest purposes have toiled into the night and sweated their very life's blood to give farmers' organization and cooperative movements the impetus which they have earned today. We know their problems and the frightful loss which the failure of a farmers' movement entails. There is too great a danger of a total collapse of the farmers' confidence in all organizations for us to risk the endorsement of a proposition, which from what we have learned of it to date, appears to lack the essentials of certain success, therefore we ask every reader of THE BUSINESS FARMER, to investigate thoroughly before investing in the Grain Marketing Company of Chicago.

We shall be interested to learn when they begin the canvass of Michigan for the sale of stock in this company. We hope our readers will keep us informed and also mail us copies of circular matter which they receive regarding it. This proposition will well bear watching and we believe it is the duty of every man interested in the future of cooperative marketing to be alert to its ramifications.

A GREAT LOSS

WITHIN sight of the home he loved, Professor Frank R. Spragg, assistant professor of farm crops at M. A. C., with his beloved wife and ten year old boy, were struck by a train on August 13th, and hurled into the great unknown. So shocking a loss has not been felt at the college in a great many years and gradually as the importance of this man to agriculture is known, will the loss be keenly felt all over the country, if not the world.

Our own readers have been following for months a series of articles by Professor Spragg, in which he has covered the inovations in plant-life which he will, as time passes, be given full credit for. Even now, we have yet to publish one or two articles which were awaiting publication when he was taken away from us.

Rosen rye, Wolverine oats, Hardigan alfalfa, Berkley Rock wheat and other improved varieties of seeds were discovered by this modest man who toiled with so little recognition and such great results at East Lansing. Who then can fathom the depth of the loss in which this one man's death has placed agriculture not only in Michigan, but in the whole world?

God grant, that somewhere there are hearts that know no fatigue and brains that dream of things yet unknown who can carry on the work which Frank Spragg had so well begun!

DETROIT WELCOMES STATE FAIR VISITORS

BECAUSE Michigan's metropolis has put on long-pants since becoming the fourth city, in point of population in the United States, is no reason for assuming as the politicians would some times have us believe, that Detroit is not friendly to visitors from up-state.

As a matter of fact, the better part of Detroit's population came from "somewhere in Michigan!" Most of her leading business men, manufacturers, merchants and public officials are up-state boys.

They want you folks to drive in the week of the state fair and make yourselves at home. They feel disappointed if you stop at the Fair Grounds and do not come down-town. Check your car somewhere near the grounds and take a trolley down-town. Better still, climb on top of a Second Avenue bus and get a bird's-eye view of the city, all the way to the heart of town, for a silver dime.

Come to Detroit and enjoy all that great city has to offer you, because, you have been invited and because back of the invitation is a sincere "do come!"

HOW TO SEE A FAIR

TWO men go to a state fair and what each sees is almost entirely different. One returns home smelling of the midway and filled with a conglomerate mixture of pop-corn, taffy, red-hots and ginger-ale—but a mind as empty as his pocket-book.

The other man looks first for the exhibits of the special farm product in which he is most interested and, be it bees or bulls, he finds the best which the state or county affords displayed for his approval. He finds men and women in charge of these exhibits who are the best posted authorities on their subject; he asks questions and often he makes acquaintances which stand him in good stead for years to come.

Next, he takes in the educational exhibits of the fair in which he or his family are most interested. He goes with mother through the womens building and even stands with daughter before a beautiful painting in the art building or with son he dives into the intricacies of the boy scouts' work. If he can spend more than one day at the fair he finds ample things of interest to fill every moment. He goes home well-repaid for his visit and with mind well-filled with subjects to discuss with the family or ponder over in the fields for many months to come.

PUBLISHER'S DESK

THE HOME PROFIT KNITTER DEFUNCT

WHEN the news reached my desk that the Home Profit Hosiery Company was in the receivers' hands, I immediately took steps to have an investigation made and our representative Mr. Fletcher, from our New York office went directly to Rochester and made me the following report:

"If you have any complaints from ceedings in Rochester on the 28th of July. It was established that there are between seven and eight thousand creditors, and it is expected that the assets will not reach the $10,000 mark. The chances, therefore, are very remote.

"If you have any complaints from readers who have paid money on machines and have not received them, I would suggest that you file proper claim and mark them "Priority Claims." This was the advice given me by the secretary of Judge Sanford, who is Referee in Bankruptcy.

"Mr. E. V. Cleary, attorney at Rochester, is handling most of the claims for creditors and it might be advisable to get in touch with him."

We suggest that all readers of THE BUSINESS FARMER who have claims of any nature, should present them to Mr. Cleary, whose address is 906 Wilder Bld., Rochester, N. Y., who will present them to the referee in bankruptcy and we expect, charge only a nominal commission on what he collects for you.

So far as we can learn this company lived up to all their promises, so far as buying back the work, etc., but apparently they were not on a sound financial basis and could not stand the strain. There is a ray of hope in the fact that the machine is a good one and will do the work, but under the present circumstances it will not, of course, be possible to hold the company to their promise to buy back the completed hosiery and it will be necessary for those who own them to sell their product in their own neighborhoods.

It has come to our attention that twenty-five women in the city of Minneapolis have formed themselves into a cooperative knitting club, buying their yarn and needles at wholesale and selling the socks they knit to either the local retail trade or to friends. This permits them to not only work out the cost of the machine, but also gives a larger profit as such local sales are seldom affected by the present depressed condition of the wholesale market.

We understand that Mr. H. B. Watson, 21 Marlborough Road, Rochetser, New York, in answer to the request of these women in Minneapolis, has made it possible for them to purchase needles and yarn at wholesale prices, and we take it for granted that he is willing to extend this same cooperation to others who may desire it.

NEWSWRITER TRAINING BUREAU

"I would like to ask you if 'The Newswriter Training Bureau,' Buffalo, New York, William A. Heacock, managing director, is honorable and trustworthy."—G. L., St. Clair County.

WE wrote this firm requesting information regarding their course and after waiting over a month and receiving no reply we wrote again sending the letter by registered mail. The letter reached them but they did not take the time to reply in any way. The closing paragraph in our last letter was "If you are doing a strictly legitimate business and want more students you should be anxious to volunteer all information desired." Perhaps they do not want more students, so would advise our reader to look elsewhere for a place to spend her money.

The Collection Box

The purpose of this department is to protect our subscribers from fraudulent dealings or unfair treatment by persons or concerns at a distance.

In every case we will do our best to make a satisfactory settlement or force action, for which no charge for our services will ever be made, providing:

1.—The claim is made by a paid-up subscriber to The Business Farmer.

2.—The claim is not more than 6 mos. old.

3.—The claim is not local or between people within easy distance of one another. These should be settled at first hand and not attempted by mail.

Address all letters, giving full particulars, amounts, dates, etc., enclosing also your address label from the front cover of any issue to prove that you are a paid-up subscriber.

THE BUSINESS FARMER, Collection Box
Mt. Clemens, Mich.

WATCH OUT FOR BAD CHECKS

DURING the summer there are always strangers going about the country buying loads of vegetables, apples or poultry from the farmers. Most of these strangers pay cash for what they buy but we have heard recently of several cases where farmers accepted checks and then when they went to cash them found they were no good. I have a letter from a "victim" before me that reads as follows:

"I wish you would publish a piece in your valuable paper warning people not to accept checks in payment for their farm produce if they don't positively know the person who gives the check is reliable. We were unlucky enough to get stung $44.00 worth by a man from Jackson who gave us a check in payment for potatoes, check being no good as we found later when we tried to cash it. He stung four other farmers here the same way. There seems to be quite a number of his kind swindling the people out of their money with worthless checks."

Insist on the cash unless you are well acquainted with the man and know him to be honest. "A bird in hand is worth two in the bush." Even though prices are not very high it is better to keep the produce yourself than to give it away to some stranger.

WE ALL MAKE MISTAKES ONCE IN A WHILE

THEY say the reason rubbers are put on the end of pencils is that we all make mistakes now and then—none of us are perfect. Well, we buy pencils with rubbers on them and sometimes have to use the end with the rubber on. But once in a while we fail to catch a mistake and the result is your name may be misspelled on your label, or there is some other little error. Then it is up to you to call the matter to our attention and we are always thankful to you for doing it. The mistakes are not always ours remember. Some send in their subscription and fail to sign their name plainly or leave off their address and in a few cases we have been unable to find the name any place although we have read the letter over two or three times searching for it. Whether it is our mistake or yours write in and tell us about it. We are always glad to hear from our readers. If your letter is about your subscription address it to the attention of the Circulation Manager, if you want the Editor to get your letter address it to the attention of the Editor, and if you want to get your letter into the hands of the Publisher address it to his attention. This should apply also if you want your letter to go to any certain department such as Farmers' Service Bureau, Radio Department, etc.

THANKS!

Dear Srs:—I received the money from ——— and wish to thank you for your kind service. I know without your help I should never have gotten it.—R. R., Mancelona, Mich.

Dear Sirs: Will let you know I have received a check from the ——— company and thank you very much for your prompt attention toward my other letters and helping me to get my pay. Thanking you again, I am—Mrs. F. C., Merrill, Michigan.

I received a letter from ———. They sent me a check. I will send you a letter they sent me last week. I never would have gotten one cent had you not taken it up. I feel as though you ought to get paid for your trouble at least. I assure you I will do all I can for The Business Farmer. Accept my thanks for your kindness. I will advertise this kind deed.—Mrs. C. C., Yale, Michigan.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

DEAR FOLKS: Are your boys and girls all ready for school? It will only be a few days before school starts in the country and now is the time to check up to see if they are ready. And by "ready" I do not mean just if you have clothing for them and if they are in the right frame of mind—no indeed. If they have complained of headaches or tired eyes have you had their eyes examined and fitted with glasses if needed? Have you taken them to the dentist to see if their teeth are in first class condition? Are they feeling all right? If you want them to do their best in school and get the most out of their studies they must be physically and mentally fit. No matter where your boys or girls are going to school they should be ready when school opens. Think this over.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

JUST THE HIRED MAN

My pants are baggy—knees are out
My coat is faded grey,
My socks are darned a dozen times
But mates were never they;
My boots, like alligator jaws,
Are worn around the toes,
My hat a new Fedora was—
But when no mortal knows.
My sweater's all a ribboned wreck,
I'll wear it all I can,
And no one minds, for I am just
The tattered hired-man.

I've hired out for many years
At wages great and small.
Though I haven't saved as misers do,
I haven't spent it all.
But with all my expenses met,
I've put a little by
To tide me over troublous times,
And that's the reason why,
With such a carefree countenance
All humankind I scan,
And nothing worries me, for I'm
The happy hired-man.

Then when the hoppers eat the wheat
The boss has tried to grow,
And rust and hail and drought and frost,
Those harbingers of woe,
Come helter-skelter on his head
That's getting grey with care;
And dunners chase from off his face
The smile he used to wear;
I sympathize with all my heart
And thank the Mighty Plan
That made me what I am, and that's
The lucky hired-man.

—Nor'-West Farmer.

SEPTEMBER IN THE COUNTRY

A FEW more days and then the call to return to the schoolroom will be answered by over 300,000 rural boys and girls throughout the land. Most of them will enter buildings freshly cleaned, some redecorated, to make them more pleasant and suitable "temples of learning." A few will enter new buildings dedicated " to the service of the community and to the common cause of a better life for all."

Most of this youthful throng are eager to return and join their school friends. Most of them will enter advanced grades with new fields of study to explore. Most of them will have new teachers. About one-fifth of them will be entering school for the first time. A few of them will be entering schools in new communities into which they have moved or to which they must go for advanced educational instruction.

Everything possible should be done to make the first week a red letter week for the beginners and the newcomers, to be remembered by them for the remainder of their lives. First impressions are lasting impressions. A favorable attitude towards school and community gained during these first few days will largely determine the wholeheartedness with which these pupils will enter into cooperation with the school and its enlarged society.

Just as first impressions largely determine the attitude of the pupils so do they affect the teacher. The teacher should become an integral part of the community during her period of tenure. Most teachers realize this and are glad to respond to the welcome extended them by the community. The teacher will not only be happier but she, in increased service, will repay the community for any efforts expended in her behalf.

THREE TYPES OF SLEEVES AND HOW THEY ARE MADE

PRACTICALLY all sleeves may now be divided into three types, the kimona sleeve which is cut in one with the waist section, the set-in sleeve and the raglan sleeve. The first two types take their names from the manner in which they are attached to the garment and not from their shape.

The advantage of the kimona sleeve is that one is saved the work of cutting and putting in a separate sleeve. A kimona sleeve should never be made of material which has not enough body or weight in itself to hang well. A kimona sleeve in organdy is not attractive because of the stiffness of the material which causes it to stick out instead of hanging in proper position. People inclined to stoutness should not wear kimona sleeves.

The advantage of a set-in sleeve is that it breaks the line of the garment at the shoulder, and allows the waist to conform somewhat better to the lines of the figure under the arm. Its only disadvantage is the labor necessary to put it in so that it will hang correctly.

A raglan sleeve is cut with the top extending to the neck. It is easy to adjust and comfortable, but is apt to make the wearer look round shouldered. It should not be used in thin materials.

It is generally advisable to pin in the sleeve carefully before basting, matching the notches. In case alterations are necessary remember that at the present time most patterns require the highest part of the curve at the top of the sleeve to be placed at the shoulder seam, which is now directly on top of the shoulder.

Hold the sleeve toward you in pinning and basting it in, and if there seems to be too much fullness to fit into the armseye, try to "ease" it in by pushing it along with the thumb of the left hand during the basting. If, perchance, the shoulder and underarm seams have been taken up so that the fullness in the sleeve cannot be "eased" in, it may be necessary to slip it up into the armseye a little more. If this is done be sure that the sleeve is slippedped up all around, else it will pull and wrinkle around the outside of the arm just below the shoulder.

The top of the sleeve should be a little larger than the armseye to allow for the fullness and movement of the upper part of the arm.—Blanche E. Hyde, Clothing Specialist, Colorado Agricultural College.

'AS PRETTY AS A PICTURE

NO one knew that Mother had bought a camera with her birthday money. It rather amused her to consider the remarks that such a knowledge would have evoked.

"Thought you were crazy about new aluminum saucepans?" father would suggest wonderingly.

"Oh, mother, why didn't you get something for the house?" would be daughter's tragic wail.

"What do you expect to make a picture of in this forsaken burg?" son would scroff rebelliously.

Mother loved the farm. Father had loved it until the discontent and dissatisfaction of his children began to corrode his pride and happiness in it. "What's the use of making plans or improvements?" he demanded of mother. "Our working days will soon be over and John despises the farm and Mary is ashamed of it."

So mother secretly took her birthday money and bought a camera. "I ought to have done it long ago,' 'she chided herself," but maybe it isn't too late."

Mother spent unaccustomed hours in unaccustomed places. Her subsequent visits in town each held a secret mission. One day she returned with a long, flat package.

"A picture," exclaimed daughter a little doubtfully. Then as the picture was unfolded, a beautiful scene in sepia tints encircled by a dull brown frame: "Oh, mother, how lovely! W-why, it looks like—"

"It is," said mother pleasantly. "Our own woods in the background with the cows gathered about the spring in the pasture. Doesn't Molly N look like the prize-winner she is?"

Well, Well! It was undeniably a beautiful picture—everyone who came into the room noticed and admired it. "Yes, indeed, it was taken right here on our farm," mother invariably exclaimed.

Other pictures were forthcoming. That bend in the lane where the clump of thorns grew and father driving home the big team. The old stone wall, vine-draped monument of an older generation's toil and perseverance.

"Finest piece of oats I've seen," declared the visiting county agent. So mother took a picture with John standing in the midst to emphasize the height and the picture came out in the Farm Bureau News.

The old trash pile at the end of the shed seemed to have become a permanent fixture. But mother persisted until her reluctant menfolks cleared it away and repaired and painted the shed. When she sprang her "before and after" pictures, father admitted: "Well, it certainly was worth while. I had no idea it did look quite so bad!"

It really was surprising how much finer and more interesting the old place looked in a picture than one had supposed. It was surprising what an improvement each slight innovation made—for mother was unrelenting in her "before and after" campaign.

In fact, there is no denying that a new love and appreciation and pride in the old farm followed mother's unexpected purchase of a camera.

DOCTOR TELLS WHAT TO DO FOR PIMPLES

A CURE for pimples and blackheads is one of the commonest health questions put to Dr. Lydia Allen DeVilbiss, chautauqua and lyceum lecturer on health subjects.

Dr. DeVilbiss suggests as a cure a good course in skin treatments at a competent beauty parlor, accompanied with supervision of diet and general health by a physician.

If this is impracticable, she declares, much may be done at home by keeping the skin clean, watching the diet and elimination. As a rule, soap should not be used daily. Not that soap and water hurt the skin, the doctor points out, but the trouble is that the careless person neglects to rinse the face properly. The result is that tiny particles of soap adhere to a sluggish skin; these clog the pores and the blackheads result. When the blackheads become infected, they form very disfiguring pimples.

"The distressing disfigurement of pimples and blackheads occurs at the age of puberty and has a tendency to remain until about 25 years of age," Dr. DeVilbiss says. "This is just the age when a good skin counts for most. A sensitive young person may suffer severely in mind and body if these blemishes are not removed."

HANDY TO KNOW

TO brush the teeth once a day is the least that should be considered. Morning and night are much better. The cleaning process should be up and down to get between the inner spaces of the teeth and inside as well as outside. After the teeth are thoroughly cleaned—at least five minutes being taken, the mouth should be rinsed to remove portions of food and germs which may be lodged.

Many people do not sleep enough. It does not matter that some individuals are able to get along with very little sleep. Each person in this particular is a rule unto himself, and most people require eight or nine hours to be efficient and to feel well. Ample sleep with wide open windows heads off nervous trouble and keeps the individual sweet-tempered.

Personal Column

Another Reproducer Wanted.—Would you please print this in your paper on the Farm Home page? If any reader has a four minute reproducer for an old Edison phonograph which they would like to sell, please write and give price wanted to—Mrs. John Blatt, R. 5, Brown City, Michigan.

Poem for Golden Wedding.—Will you kindly put this request in your paper. Will some one please send a good poem for a Golden Wedding.—Mrs. E. L. Purdy, Harbor Beach, Michigan.

Getting Rid of Bugs and Millers.—I am sending a recipe for getting rid of bugs and little millers which are so tantalizing around our lamps in the evening, also the large June bugs which make such noise around the screen. I take the wash tub, put in a pailful of water and suspend a lighted lantern in it, in the evening, on the porch. I leave it all night, the bugs and millers are attracted to the light and fall into the water in the tub. The water will be well coated with the bugs before daylight. I sometimes place this near the cabbage plants, for the benefit of cabbage millers. The light can be turned low after the home lights are put out.—Mrs. L. S., R1, Pierson, Michigan.

Have You Sweet Pickle Recipe?—I would like to ask if any of the readers could tell me how to make mixed sweet pickles like you buy in the stores. I would like to make some.—Mrs. H. R.

—if you are well bred!

More Finger Foods.—Asparagus is not held at the extreme end of the stalk and the end dropped into the mouth in the manner employed by the Neapolitan lazzaroni when eating macaroni. The most comfortable way to eat asparagus—and one entirely correct is to use a knife and fork cutting the stalks in half and eating the tips like any other fork food. But if you must eat them with your fingers, lift the woody end carefully, dip the head of the stalk in the sauce and—taking care not to squeeze or hold your hands so that the juice will trickle down your arm—raise the edible tip to your mouth.

In the case of the artichoke the fingers are always used. A leaf at a time is pulled from the heart, the edible end dipped in the sauce and then raised to the mouth.

Corn on the cob is usually a family dish and seldom appears at a more formal affair. It should, in fact, not be served at a formal luncheon or dinner. The ear is held lightly in the fingers at each end (sometimes a napkin is used), and a sharp steel knife may be provided to facilitate cutting the kernels from the cob.

Though birds are not finger-food in company, it is not a social crime for one thus to eat a squab or chicken-wing at his own home table. At a formal dinner the strict rule is to cut off as much meat as is conveniently possible, and leave the remainder. Hence, meat and bird bones should not be taken up in the fingers, though the fingers may be used to pull apart lobster claws.

Shrimps are served whole in the shell, and are peeled with the fingers.

Only a few hard cheeses are finger-foods. Rich, soft or crumbly ones, such as Camembert, Roquefort, Stilton, Brie, Cream, Canadian Club, etc., are eaten with a fork or transferred to bread or biscuit with the knife, and then raised to the mouth.

Tongs are usually provided for mints and bonbons but fingers—where tongs are not provided—are not barred, and this applies as well to lump sugar.

Menu for August 31st

*Country Club Chicken
Sweet Potatoes Green Corn
Tomato Salad Apple Whip
Chocolate wafers
Coffee

***Country Club Chicken.**—Wash 2 broilers or quite young chickens, cut them in halves or quarters if they be large enough, wipe them and dip pieces in beaten egg, well seasoned with salt and pepper and mixed with cream. Roll pieces in breadcrumbs and place them in greased pan, dot generously with fat and place in hot oven for 15 minutes. Now put chicken in hot kettle, cover and let smother and steam for 30 minutes or until tender on a slow fire. Place chicken on hot platter; add half cup hot cream to gravy in kettle and strain it over chickens.

RECIPES

Favorite Pickle Recipe.—This is my favorite pickle recipe, and I am sure others will be ready to say the same after their first batch providing they make them after this rule. Oh yes, I must not forget the name as it is the best part of it; "Last of the Garden." One gallon green tomatoes, chopped fine, sprinkle a little salt over and let stand a few hours, then drain one gallon cabbage chopped fine, ½ gallon corn cut off cob, after it is cooked, 1 gallon string beans cooked, 1 gallon hulled beans cooked, 12 mango peppers chopped fine, 12 onions chopped fine, 4 ripe cucumbers quartered and cooked a little, 6 carrots cooked, 1 gallon small cucumbers, 1 gallon vinegar, 2 tablespoons mustard seed, 3 pounds brown sugar, ginger and pepper to suit taste. Add all together and cook twenty minutes, then seal hot. —Mrs. C. N.. Valley Centre, Michigan.

Caramel Bread Pudding.—3 cupfuls breadcrumbs, 1 quart hot milk, 2 eggs, 1 teaspoonful lemon extract, grated nutmeg to taste, ½ teaspoonful salt, 1 cupful sugar, 4 tablespoonfuls fat, whipped cream. Put fat, crumbs, and salt into a basin, add hot milk and soak ten minutes. Melt sugar and brown it lightly in a small pan over fire, then add it to the bread, with eggs well beaten, and flavorings. Pour into greased pudding dish and bake in moderate oven till firm. Serve with whipped cream.

Sour Cream Cookies.—1 cup butter, 2 cups sugar, yolk of 2 eggs, creamed until very light, add 1 cup sour cream in which has been dissolved one level teaspoon of soda, whites of eggs beaten stiff and mix with flour. Cream flour to make stiff to roll, 1 teaspoon lemon extract.—Alma Becker.

Chocolate Brownies.—1 cupful sugar, 6 tablespoonfuls melted fat, 2 eggs, 2 squares chocolate, 1/3 teaspoonful salt, ½ cupful flour, 1 cupful chopped English walnut meats, 1 teaspoonful vanilla extract, 3 tablespoonfuls boiling water. Cream fat and sugar together, add eggs well beaten, chocolate dissolved in boiling water, salt, flour, vanilla, and nuts. Divide and spread thin in 2 greased square pans and bake in slow oven from twenty to twenty-five minutes. Cut in strips and serve with ice cream. There are a cross between cookies and heavy cake. Sufficient for fifty brownies.

The Runner's Bible

(Copyright by Houghton Mifflin Co.)

Cast they burden upon the Lord, and he shall sustain thee; he shall never suffer the righteous to be moved. Ps. 55:22.

Know that in time of trouble. "it is in the Lord's hands," your relief will be great, help will come. You cannot be in health and bear burdens of any kind.

To declare that a thing is perfect is to recognize the real, though the unseen truth, concerning it; and to declare the truth over and over is to make it finally manifest as reality.

WOMEN'S EXCHANGE

IF you have something to exchange, we will print it FREE under this heading providing: First—It appeals to women and is a bonifide exchanges, no cash involved. Second—It will go in three lines. Third—You are a paid-up subscriber to The Business Farmer and attach your address label from a recent issue to prove it. Exchange offers will be numbered and inserted in the order received as we have room. —MRS. ANNIE TAYLOR. Editor.

120.—Lovely percale, gingham and plush pieces to exchange for anything useful.—Mrs. Geo. Morgan, R. F. D. 3, Vicksburg, Michigan.

AIDS TO GOOD DRESSING

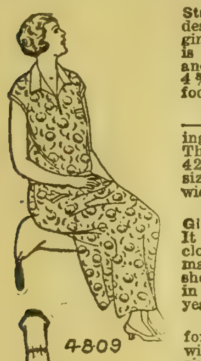
FASHION BOOK NOTICE

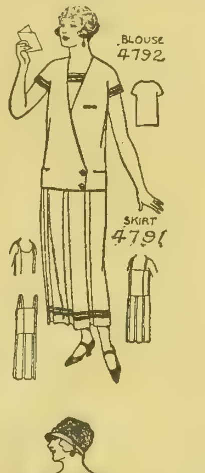
Send 10c in silver or stamps for our UP-TO-DATE FALL AND WINTER 1924-1925 BOOK OF FASHIONS, showing color plates, and containing 500 designs of Ladies', Misses' and Children's Patterns, a CONCISE and COMPREHENSIVE ARTICLE ON DRESSMAKING, ALSO SOME POINTS FOR THE NEEDLE (illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.

BE SURE AND SEND IN YOUR SIZE

4792-4791. A Good Sport Costume.—Comfort and good style are here depicted. The Bodice Skirt 4791 may be worn with any Overblouse or with a jacket or coat. The front of the bodice may be overlaid with material to form a vestee. The Blouse 4792 has smart lines, and is good for all sports material. Linen was chosen for this Costume with cire ribbon and fancy braid for trimming. The Bodice Skirt is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. The Blouse is cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. To make Skirt and Blouse for a 38 inch bust size will require 5½ yards of 40 inch material. For Bodice of lining or other contrasting material 32 inches wide 1⅝ yard is required. The vestee on the Blouse of contrasting material requires ¼ yard 9 inches wide. The width of the skirt with plaits extended is 2⅝ yards.

4808. A Stylish Dress with Slenderizing Lines.—Here is a very attractive straight line dress, with additional width supplied by "godets" or inserts at the front seams of a wide panel. The back is also in panel effect. Kasha is here combined with figured silk. One could have serge or alpaca with a trimming of braid. The Pattern is cut in 7 Sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. The width of the dress at the foot is 1⅞ yard. A 38 nich size will require 4 yards of 40 inch material. For vest, inserts and sleeve facings of contrasting material ⅝ yard is required.





4809.—A Cool Summer Frock for House or Street Wear.—Printed crepe was used for this design, with facings of sateen. Chintz, ratine, or gingham would also be attractive. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and and 46 inches bust measure. Size 38 requires 4¾ yards of 27 inch material. The width at the foot is 1⅞ yard.

4804. An Up To Date and Attractive Dress.—Printed crepe or foulard would be very pleasing for this style. One could use voile or taffeta. The Pattern is cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 3⅞ yards of 40 inch material. The width of the dress at the foot is 1½ yard.

4816. A Smart Coat Dress for the Growing Girl.—White linen was chosen for this model. It is also good for pongee, repp, jersey and boucle cloth, and for taffeta and chambrey. The sleeve may be in wrist length, or in the comfortable short length now so popular. The Pattern is cut in 4 Sizes: 8, 10, 12 and 14 years. A 12 year size requires 3¼ yards of 36 inch material.

4795. A Simple Romper Style.—Very comfortable and practical is this model. The wide leg portions are a good feature. Alpaca gingham, pongee and crepe may be used to make this pretty play garment. The Pattern is cut in 4 Sizes: 2, 3, 4 and 5 years. A 4 year size requires 2⅛ yards of 27 inch material.

4794. A Popular "Suit" for Small Boys—This is a very comfortable simple style for a practical garment. It is made with a "drop" back, which is buttoned to the waist portion. Kindergarten cloth, poplin, linen or repp, also seersucker and chambrey are nice for such suits. The Pattern is cut in 4 Sizes: 2, 3, 4 and 5 years. A 3 year size requires 1¾ yard of 36 inch material.

4810. "Slender of Line and Graceful"—Blue alpaca was used for this design. Fancy silk braid forms a pleasing finish. This is also a good style for crepe, pongee or moire. A plait portion supplies additional and graceful fullness over the front. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 4⅛ yards of 40 inch material. The width at the foot with plaits exetnded is 1½ yard.

How many bushels of wheat?

Does potash pay on winter wheat? Decidedly *yes!*

Right here in Michigan $1.75 worth of potash increased the yield nearly 4½ bushels per acre—and at $1.10 a bushel the potash not only paid for itself but brought in a $3.00 extra profit. The formula used was 3-9-10, and it was tested out by your own Michigan Agricultural Experiment Station, against no fertilizer at all and against 3-9-0, a no-potash formula.

Yes, *potash pays.* And in your rotation system potash that you apply to wheat also increases the yield of succeeding crops. The potash that gave $3.00 extra profit on wheat also brought in 160 pounds more clover and 36 bushels more corn than the no-potash formula.

All from $1.75 worth of potash!

Potash strengthens the stalk and prevents lodging of the grain under high winds and heavy rains. Your wheat will be harder, plumper and the shrinkage will be less. Your grade will be improved with potash—adding still more profit per acre to your income.

Make money on winter wheat. Insist upon having 6% to 10% of Genuine German Potash in the fertilizer you buy. The extra bushels you get take no more seed. You'll be glad to pay the slightly increased threshing charge.

The Bushels That Made Me Money

You should read this interesting story before you plant your winter wheat. Your copy will be sent free of all cost. Simply ask for booklet, "The Bushels That Made Me Money." But do it now!

The Children's Hour

OUR GIRLS AND BOYS

Dear Uncle Ned:—Yes, I live on a farm and am enjoying it too. Who wouldn't where everything is so free and beautiful? We take the M. B. F. and I certainly enjoy its helpfullness. I suppose I should tell you a little something of myself. I am 19 years old and my birthday was last month, (July). I am only five feet tall so of course I get teased but I don't mind it. I am going to do something unusual, and just sign my nickname but if this letter is lucky enough to be printed maybe I will sign my real name next time. You see I am a little bashful. If you wish you may print this poem. I made it up some time ago. Will close and give the other boys and girls a little room. Wishing to be your niece will sign this—"Tiny", Cass City, Michigan.

Happy Days of Long Ago

I am sitting here and thinking
  Of the days so long gone by.
When father, mother, my two sisters and I
  Were happy and contented living in that
    dear old home.

There's been many trials and troubles
  Since those happy days of yore
And the tears still come unbidden
  As I sit and think them o'er.

I am thinking now of father,
  And the days that used to be
When we as little children
  Clamored there upon his knee.

Father has left us now
  For that happy golden shore,
Where there will be no more sorrow,
  And the parting days are o'er.

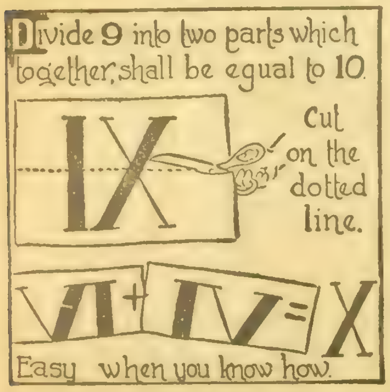
And the rest? For we have wandered
  From that home of long ago
But still our memory reaches back
To the home that we loved so.

And now, my little children dear,
  How happy you should be.
All living there to-gether
  In that little home|. You see?
—"Tiny", Cass City, Mich.

Dear Uncle Ned:—Your circle of boys and girls is a very friendly one. May I come in? I like to read the letters in the Children's Hour. I am fourteen years of age, weigh 120 pounds or more, have light brown hair, brown eyes, light complexion and am 5 feet 4 inches in height. Will be a freshman in high school next year. I would be glad to hear from some of the young folks, I will answer all letters even though I am a busy farmer girl. I spent the fourth in the usual way, "making noise." We had a young Jersey calf born on "Independence" and that became her name. A good one, eh? One third of our summer vacation is gone already and soon another and the—Oh dear! Well maybe it will seem good to get back to school after our three months is really up. I guess it most always does. It is pretty early to begin to dread it anyway. Summer certainly goes fast but we have a good time while it is here. Well I must ring off. Good-bye and good luck. Another niece—Eunice McBride, Hopkins, Michigan.

Dear Uncle Ned:—My father takes the M. B. F. and we enjoy it very much. I thought I would write. Billy Frank said every girl that would guess his age which is between 15 and 20 would receive a real box of——. Well I think his age is 18. Is that right? Well I had better describe myself. I am 5 feet 1 inch tall, weigh 104 pounds, am 11 years old and my birthday is the 16th of August, have brown bobbed hair. For pets I have 2 cats and 1 dog. We live on an 80-acre farm. I have 4 brothers and 6 sisters. Well I hope Mr. Waste Basket don't gobble my letter up. Your niece,—Ardith Jordan, R1, Turner, Michigan.

Dear Uncle Ned:—May I join your merry circle? I wrote but my letter was not in print. Well I will describe myself. I am 5 feet 2 inches tall and weigh 115 pounds, have black hair and blue eyes. I am 14 years old. I live on a 160-acre farm and we have 6 cows, 5 horses, 41 sheep, 26 lambs and for pets I have a dog and a cat. I think Florence Coleman is 14 years old. Well I will close with a riddle. Why do girls like to look up at the moon? The one who guesses the answer correct will receive a letter from me. Only two chances, remember. Will close. I am—Annie Bankel, West Branch, Mich., R2, Box 23.



Divide 9 into two parts which together, shall be equal to 10.

Easy when you know how.

A Surprise For Uncle Ned

DEAR Young Folks:—Well, even old Uncle Ned had to have a vacation!

And where do you suppose he is? Why, maybe he passed right in front of your gate, because the last we saw of him he was heading right up into northern Michigan, with a camping outfit snuggly packed in the rear seat of his Ford sedan. If you see a Ford sedan with a tall man wearing shell-rim glasses and driving like the wind, just shout "O, Uncle Ned, I know you!" and ten to one he will stop and say "Howdy!" But don't tell him that I told you where he was going, or what he looked like or he might cut off his whiskers just so you could not recognize him.

Now let's have some fun while he's away!

Do you ever read the advertisements in THE BUSINESS FARMER?

Well, it will pay you to read them all this week, because I am going to offer

FIVE WHOLE DOLLARS IN PRIZES!

I want you to write me answers to the following questions first:—

1.—What store in Detroit is going to have a big sale and why are they going to have it?
2.—What state does Ferndell, a cow which produced 13,477.9 pounds of milk come from and what has the herd she comes from been fed for 13 years?
3.—What is the secret of one tires ability to stand hard-knocks and what tire is it?
4.—How should sugar-beets be lifted?
5.—What is a savings bank for corn?
6.—How can you save ¼ to ½ on a stove, range or furnace?
7.—What bonds pay 7%?
8.—What did $1.75 worth of something do and what was it?
9.—What is the name of a new cord fabric?
10.—What advertisement in the August 30th issue did you like best and why? (Not over 50 words.)

When you have answered all of these questions, send in your letters to Uncle Ned, so he will find a great big job waiting for him to decide which letter is best. Be sure and write on only one side of the paper and sign your full name and age on the top of each page.

$3.00 IS THE FIRST PRIZE, for a full list of correct answers and the best letter in answer to Question No. 10. $1 is the Second Prize and 50c each to the next two best.

All letters must be mailed not later than September 10th.

Your friend till Uncle Ned gets back!

THE PUBLISHER.

Dear Uncle Ned:—It has been quite a while since I wrote I just wondered if you would print this. I wonder what all the cousins are doing this summer. I am staying at home as I had an operation for appendicitis a short time ago and I am not strong enough to work. Say Uncle, do you ever get the blues or do any of you cousins? If you do please write to me as I get them too. I was vaccinated yesterday. There is no need for me to describe myself as I have written before. We are soon going to move out of the lovely country into the horrid town. Don't you pity me? I do love the farm don't you Uncle Ned? It is raining to-night and I was lonesome so I thought you would give me a small place in the corner for this letter. Won't you Uncle? I will watch for it anyway. I guess it will fill quite a corner. Ha! Ha! Hoping to hear from some lonesome cousins I will close. Your niece,—Lena Ables, R3, Montgomery, Michigan.

Why Mr. Horse and Mrs. Giraffe Are Enemies

MRS. Giraffe and Mr. Horse were, long, long ago, fast friends. But Mr. Horse became so boastful about his ability to run fast, that Mrs. Giraffe grew very weary of hearing him boast.

"I can run faster than any other animal," Mr. Horse told Mrs. Giraffe.

"You can not run faster than I," challenged Mrs. Giraffe.

"Ho, ho, haw, haw," laughed Mr. Horse. "I can run much, much faster."

At this Mrs. Giraffe became very, very angry and pulled out a long hair from Mr. Horse's mane and two from his tail and swallowed them. No very easy feat, as they were several feet long.

"Well, Friends," Mr. Camel spoke up, "suppose tomorrow at nine o'clock you run a race and that will settle the argument."

"Very well," Mrs. Giraffe agreed, "we shall run a race and we shall see what we shall see."

"Indeed, yes," Mr. Horse snoffed, "we shall see what we shall see."

"You think you can win but indeed you can not, Friend Horse," Mrs. Giraffe scoffed.

"I will win this race by several miles" Mr. Horse boasted.

At this remark Mrs. Giraffe sat back on a big rock and laughed till the tears ran down her long, very long neck.

"Look here, old Spotted Face," Mr. Horse crossly spoke, "you laugh too soon."

* * *

The next morning at exactly nine o'clock Mr. Camel, Mrs. Giraffe, Mr. Horse and many of their friends met for the race.

When Mr. Camel said "Go!" Mr. Horse and Mrs. Giraffe started. They were both very swift; Mrs. Giraffe always gaining when it came to broken ground and rocks, as she could hop over these like a huge frog. When Mrs. Giraffe was ahead she would turn her very long neck and laugh very loudly at Mr. Horse.

This made Mr. Horse quite angry, and he would run faster than ever.

All the animals were excited over the race. The ones who were friends of Mrs. Giraffe wore large blue ribbons and the friends of Mr. Horse wore scarlet ribbons.

Toward the end of the race there was much yelling and cheering for the two runners.

Faster, faster, faster, they came. All the animals were wondering who would win, and were cheering.

Almost had they reach their goal! The animals were all pushing to get a good view of the best part of the race. Mr. Horse was running as fast as a horse ever ran since the world began and Mrs. Giraffe was leaping as she had never leaped before.

They came faster, faster, faster. But my, oh me! neither one was ahead. They were side by side. The animals were very worried.

"It will be a great disappointment to all of us," Mr. Camel moaned, "we want a winner."

Faster, faster, faster came Mr. Horse and Mrs. Giraffe. At last they reached their goal, but my, oh me, they were still side by side. Neither had won.

Mr. Camel was ready to call the race a tie when Mrs. Giraffe craned her long, long neck as long as she could and—stuck out her long, long, tongue.

Mrs. Giraffe's friends yelled and shouted with glee. Mrs. Giraffe had won! But ever since then Mrs. Giraffe and Mr. Horse have been bitter, bitter enemies.—Helen Gregg Green.

Dear Uncle Ned:—I am sending a little poem in. I have been reading M. B. F. for a long time so thought I would write to you. I am a girl twelve years old, four feet and three inches tall, have light brown hair, brown eyes, rather dark complexion. I am in the seventh grade at school. I live on a forty acre farm with my grandfather. For pets I have three cats, one dog, three ducks, twenty-eight chickens. Grandpa has two horses and six head of cattle. I hope this doesn't go into the waste basket. Your want-to-be niece,—Merab C. Colwell, R2, Box 2, Petoskey, Michigan.

A Rill's Life

I come from a little spring,
  I bobble over stones and sing;
I am a little rill,
  I love to race down hill.

I run under stars and sun
  I gush over boulders weighing tons,
I go by a town,
  But always run down—down

My life is a pleasure
  I wish for nothing better,
I have a sand bed
  On my banks are flowers red.

I ran into a little creek
  Over boulders bound to creep;
In and out I turn and leap
  I always have a song so meek.

In and out of shady nooks,
  Now I run into a brook;
But still I laugh and play
  Thinking I am on my way.

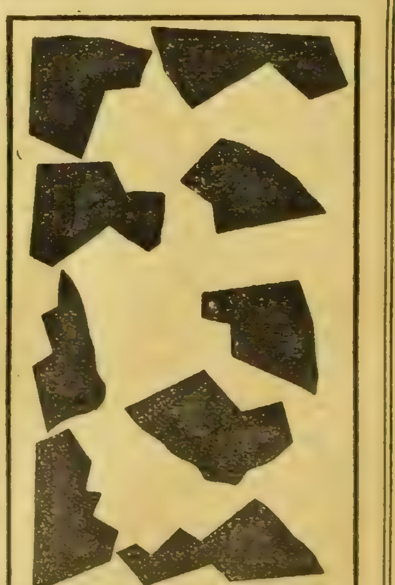
Into a river now I swing
  Over many falls I ring.
Now I come unto a mill
  But I keep running still.

Now I run into the ocean,
  Now I make much more motion;
But still I laugh and play,
  Thinking now I am all the way.

Now I join many others,
  They are all my brothers;
And now we foam
  And on us great vessels roam.
—By Merab C. Colwell,
R2, Petoskey, Mich.

Dear Uncle Ned:—I am 5 feet and 3 inches tall and weigh 122 pounds. The one that guesses my right age will receive a letter from me. I am between 12 and 15 years old. Billy Frank's age I will guess is 17 years. Is that right? Will have to close. Would like to hear from some of the boys and girls. Want-to-be friend—Pearl Brocker, R1, Wayland, Michigan.

Dear Uncle Ned:—My father takes the M. B. F. and we like it very much, or I do anyway and I read the Children's Hour every issue. Well summer is here again and with it the birds and flowers. I like summer better than any other time of the year. Don't you too Uncle Ned? Well I shall have to describe myself. I am 5 feet 1 inch tall and I have medium brown bobbed hair and blue eyes and I weigh about 97 pounds. I am twelve years old and my birthday is the first day of May. Have I a twin? Well I will take a guess at Billy Frank's age. I think he is about 17. Am I right Billy? This will have to be all for this time or the waste basket will get my letter. Your want-to-be niece—Esther Shively, Cook, Michigan.
—I like summer but the other seasons are nice too, I think.



Cut out each piece carefully, and paste the nine pieces together on stiff cardboard to form the silhouetts of a sour variety of fruit. What is it?

Answer to last puzzle: K plus Cow plus Nail plus Pie minus Cone plus Pen minus Pipe plus Cup minus Pick plus Butt minus Tub equals WALNUT.

OH, MONEY! MONEY!

(Continued from page 10.)

tain to me, but Jim and Fred say they'll help,—"

Mr. Smith did not hear any more, for Miss Maggie and her guest reached the hall and had closed the door behind them. But when Miss Maggie returned, Mr. Smith was pacing up and down the room nervously.

"Well," he demanded with visible irritation, as soon as she appeared, "will you kindly tell me if there is anything—desirable that that confounded money has done?"

Miss Maggie looked up in surprise.

"You mean—Jim Blaisdell's money?" she asked.

"I mean all the money—I mean the three hundred thousand dollars that those three people received. Has it ever brought any good or happiness—anywhere?"

"Oh, yes, I know," smiled Miss Maggie, a little sadly. "But—" Her countenance changed abruptly. A passionate earnestness came to her eyes. "Don't blame the money—blame the spending of it! The money isn't to blame. The dollar that will buy tickets to the movies will just as quickly buy a good book; and if you're hungry, it's up to you whether you put your money into chocolate ecclairs or roast beef. Is the money to blame that goes for a whiskey bill or a gambling debt instead of for shoes and stocking for the family?"

"Why, n-no." Mr. Smith had apparently lost his own irritation in his amazement at hers. "Why, Miss Maggie, you—you seem worked up over this matter."

"I am worked up. I'm always worked up—over money. It's been money, money, money, ever since I could remember! We're all after it, and we all want it, and we strain every nerve to get it. We think it's going to bring us happiness. But it won't—unless we do our part. And there are some things that even money can't buy. Besides, it isn't the money that does the things, anyway,—it's the man behind the money. What do you think money is good for, Mr. Smith?"

Mr. Smith, now thoroughly dazed, actually blinked his eyes at the question, and at the vehemence with which it was hurled into his face.

"Why, Miss Maggie, it—it—I—I—"

"It isn't good for anything unless we can exchange it for something we want, is it?"

"Why, I—I suppose we can give it—"

"But even then we're exchanging it for something we want, aren't we? We want to make the other fellow happy, don't we?"

"Well, yes, we do." Mr. Smith spoke with sudden fervor. "But it doesn't always work that way. Look at the case right here. Now, very likely this—er—Mr. Fulton thought those three hundred thousand dollars were going to make these people happy. Personification of happiness—that woman was, a few minutes ago, wasn't she?" Mr. Smith had regained his air of aggrieved irritation.

"No, she wasn't. But that wasn't the money's fault. It was her own. She didn't know how to spend it. And that's just what I mean when I say we've got to do our part—money won't buy happiness, unless we exchange it for the things that will bring happiness. If we don't know how to get any happiness out of five dollars, we won't know how to get it out of five hundred, or five thousand, or five hundred thousand, Mr. Smith. I don't mean that we'll get the same amount out of five dollars, of course,—though I've seen even that happen sometimes!—but I mean that we've got to know how to spend five dollars—and make the most of it."

"I reckon—you're right, Miss Maggie."

"I know I'm right, and 'tisn't the money's fault when things go wrong. Money's all right. I love money. Oh, yes, I know—we're taught that the love of money is the root of all evil. But I don't think it should be so—necessarily. I think money's one of the most wonderful things in the world. It's more than a trust and a gift—it's an opportunity, and a test. It brings out what's strongest in us, every time. And it does that whether it's five dollars or five hundred thousand dollars. If— we love chocolate eclairs and the movies better than roast beef and good books, we're going to buy them, whether they're chocolate ecclairs and movies on five dollars, or or —champagne suppers and Paris gowns on five hundred thousand dollars!"

"Well, by—by Jove!" ejaculated Mr. Smith, rather feebly.

Miss Maggie gave a shamefaced laugh and sank back in her chair.

"You don't know what to think of me, of course; and no wonder," she sighed. "But I've felt so bad over this—this money business right here under my eyes. I love them all, every one of them. And you know how it's been, Mr. Smith. Hasn't it worked out to prove just what I say? Take Hattie this afternoon. She said that Fred declared she'd been trying to make every one of her 'Jims' a 'James,' ever since the money came. But he forgot that she did that very same thing before it came. All her life she's been trying to make five dollars look like ten; so when she got the hundred thousand, it wasn't six months before she was trying to make that look like two hundred thousand."

"I reckon you're right."

"Jane is just the opposite. Jane used to buy ingrain carpets and cheap chairs and cover them with mats and tidies to save them."

"You're right she did!"

Miss Maggie laughed appreciatively.

"They got on your nerves, too, didn't they? Such layers upon layers of covers for everything! It brought me to such a pass that I went to the other extreme. I wouldn't protect anything—which was very reprehensible, of course. Well, now she has pretty dishes and solid silver—but she hides them in bags and boxes, and never uses them except for company. She doesn't take any more comfort with them than she did with the ingrain carpets and cheap chairs. Of course, that's a little thing. I only mentioned it to illustrate my meaning. Jane doesn't know how to play. She never did. When you can't spend five cents out of a hundred dollars for pleasure without wincing, you needn't expect you're going to spend five dollars out of a hundred thousand without feeling the pinch," laughed Miss Maggie.

"And Miss Flora? You haven't mentioned her," observed Mr. Smith, a little grimly.

Miss Maggie smiled; then she sighed.

"Poor Flora—and when she tried so hard to quiet her conscience because she had so much money! But you know how that was. You helped her out of that scrape. And she's so grateful! She told me yesterday that she hardly ever gets a begging letter now."

"No; and those she does get she investigates," asserted Mr. Smith. "So the fakes don't bother her much these days. And she's doing a lot of good, too, in a small way."

"She is, and she's happy now," declared Miss Maggie, "except that she still worries a little because she is so happy. She's dismissed the maid and does her own work—I'm afraid Miss Flora never was cut out for a fine-lady life of leisure, and she loves to putter in the kitchen. She says it's such a relief, too, not to keep dressed up in company manners all the time, and not to have that horrid girl spying 'round all the day to see if she behaves proper. But Flora's a dear."

"She is! and I reckon it worked the best with her of any of them."

"Worked?" hesitated Miss Maggie.

"Er—that is, I mean, perhaps she's made the best use of the hundred thousand," stammered Mr. Smith. "She's been—er—the happiest."

"Why, y-yes, perhaps she has, when you come to look at it that way."

"But you wouldn't—er—advise this Mr. Fulton to leave her—his twenty millions?"

"Mercy!" laughed Miss Maggie, throwing up both hands. "She'd faint dead away at the mere thought of it."

"Humph! Yes, I suppose so." Mr. Smith turned on his heel and resumed his restless pacing up and down the room. From time to time he glanced furatively at Miss Maggie. Miss Maggie, her hands idly resting in her lap, palms upward, was gazing fixedly at nothing.

"Of just what—are you thinking?" he demanded at last, coming to a pause at her side.

"I was thinking—of Mr. Stanley G. Fulton," she answered, not looking up.

"Oh, you were!" There was an odd something in Mr. Smith's voice.

"Yes. I was wondering—about those twenty millions."

"Oh, you were!" The odd something had increased, but Miss Maggie's eyes were still dreamily fixed on space.

"Yes. I was wondering what he had done with them."

"Had done with them!

"Yes, in the letter, I mean." She looked up now in faint surprise. "Don't you remember? There was a letter—a second letter to be opened in two years' time. They said that that was to dispose of the remainder of the property—his last will and testament."

"Oh, yes, I remember," assented Mr. Smith, turning on his heel again. "Then you think—Mr. Fulton is—dead?" Mr. Smith was very carefully not meeting Miss Maggie's eyes.

"Why, yes, I suppose so." Miss Maggie turned back to her medatative gazing at nothing. "The two years are nearly up, you know,—I was talking with Jane the other day—just next November."

"Yes, I know." The words were very near a groan, but at once Mr. Smith hurriedly repeated, "I know—I know!" very lightly, indeed, with an apprehensive glance at Miss Maggie.

"So it seemes to me if he were alive that he'd be back by this time. And so I was wondering—about those millions," she went on musingly. "What do you suppose he has done with them?" she asked, with sudden animation, turning full upon him.

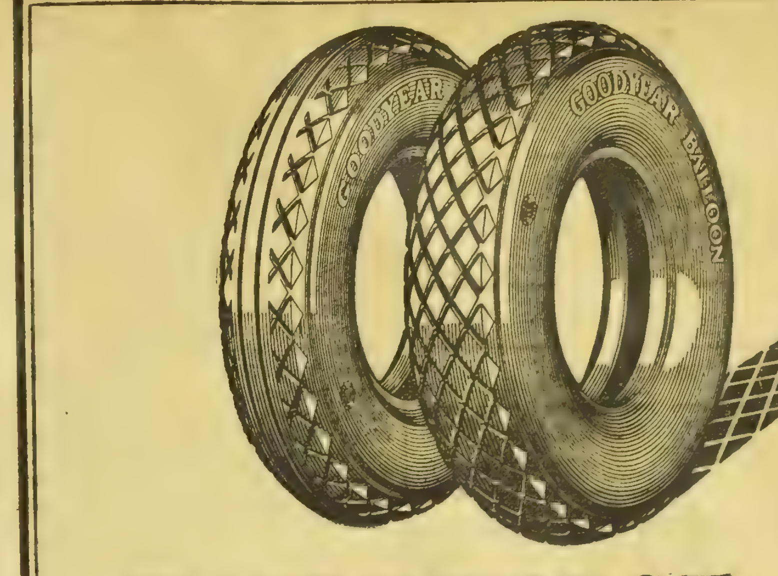
"Why, I—I—How should I know?" stuttered Mr. Smith, with a swift crimson dyeing in his face.

Miss Maggie laughed merrily.

"You wouldn't, of course—but that needn't make you look as if I'd intimated that you had them! I was only asking for your opinion, Mr. Smith," she twinkled, with mischevious eyes.

"Of course!" Mr. Smith laughed now, a little precipitately. "But, indeed, Miss Maggie, you turned so suddenly and the question was so unexpected that I felt like the small boy who, being always blamed for everything at home that went wrong, answered tremblingly, when the teacher sharply demanded, 'Who made the world?' 'Please, ma'am, I did; but I'll never do it again!' "

(Continued in Sept. 13th issue.)



SUPERTWIST

is a new word in the tire industry and a mighty important one. It is the name of the sensational new cord fabric developed by Goodyear. Tests show that tires made with this elastic and enduring new material *delivered as much as 100% greater* carcass *service* than tires made with an equal number of plies of standard cord fabric. In other words, ply for ply, SUPERTWIST literally *doubled* the *carcass* life of the tire. SUPERTWIST is used only by Goodyear, and is built into Goodyear balloon tires of *both* kinds—to fit new wheels, or the wheels now on your car.

Goodyear Means Good Wear

DAIRY and LIVESTOCK

MILK FEVER

WHILE the exact cause of milk fever has not yet been worked out, it seems more common just before a storm, or fall of the barometer. Just what effect this has is a puzzle, but it is a fact, nevertheless. Another thing, the kind of care or feed or amount of exercise has very little to do with the occurrence of milk fever. The curious part of the disease is that it seems to run in cycles and just about the time one thinks he has a sure preventive, up it pops. Some experienced dairymen think that only milking about half the first day or two is good; others that with holding feed before calving; others that exercise is necessary. Not a single "sure cure" has yet been worked out that is satisfactory, so the best thing we can do, as cow owners, is to be prepared for it and to know what to do when it does appear.

Symptoms—Did you know there are two different kinds of milk fever, as radically different as winter and summer? The first or common type is the "quiet" form. About a day or two after an easy calving the cow begins to act "queer." She quits eating; her muzzle gets dry; her eyes have an anxious expression, and she ceases to worry about the calf. The next thing that is noticed is that she gets weak in her hind parts. Then she staggers and fights to keep from falling down. Pretty soon she lunges forward, and either lies on her side with the head stretched out, or up in a natural position with her head curled around to her side.

After more or less struggling she seems to become drowsy, then unconscious, and passes into a profound coma. Without any aid she will usually die in from six to ten hours, depending on the severity of th eattack.

The second or nervous type is the so-called "eclamptic" form, when the animal acts almost like wild. The muscles all over the body become a twitching mass of tissue, and the eyes assume a wild aspect. She grits her teeth, often bellows and slobbers. Finally when she goes down she keeps up the convulsions and kicks and struggles. If the temperature is taken it will be found to be 105 or more. Unless promptly treated, a funeral will soon occur in this type.

Treatment — Under treatment comes the most important thing about milk fever. How to tell it is milk fever, and what not to do! Suppose you have a fine cow and she calves in a very normal condition. Everything seems fine, and you breathe a sigh of relief. The next morning you notice she acts sort of dumpish and does not eat very well. Later she pays little attention to the calf and begins to reel around. Being utterly ignorant of the true disease, you call in your next door neighbor, who thinks she "is bound up" and needs a physic. So you prepare a pound of salts in a quart of water and, with much exertion and effort, you pour the contents down the animal's mouth. Due to the paralyzed condition of the throat muscles, some of the salts go down the gullet and some down the windpipe. In this case, you have a dead cow in from two to 24 hours from mechanical pneumonia.

In other words, due to ignorance and with the best of intentions, you have done more harm with your treatment than had you done nothing.

Then again, suppose you are an experienced dairyman and known what milk fever is and how to treat the uncomplicated form yourself. But your very best cow gets the nervous type, and inflating the udder and giving stimulants only makes the patient worse. As she rapidly goes from one convulsion to another, you get alarmed and summon a veterinarian, but too late, as the toxins or poisons have hit the head and brain, and soon Bossy gives a spasmodic kick and all is over. Due to your mistaken diagnosis you have a dead cow; the veternarian gets the credit for the funeral and you swear he is no good.

While experienced car drivers can grease their autos and fix little things about the car, when something goes wrong with the engine or electric selfstarter they immediately summon expert assistance. So it is with a cow or mare during the period of giving birth. She is already overburdened with poisons; the least thing may cause her death, that at other times, would be thrown off without any treatment of any kind.

The writer, in his practice, sees so much of this that he emphasizes calling expert assistance right at the start. It is cheaper in the end. The price of a good cow will pay for a good many veterinary calls, and it will save you a lot of home doctering that may result in total loss.

A cow with milk fever, therefore, can have two different types, each utterly dissimilar and requiring the opposite treatment. Then she may develop blood poison or a total or partial paralysis of the hind quarters. She may be impacted in either the first or third stomachs. She may get garget or an inflammed udder. She may get chilled during calving and develop pneumonia. Her milk supply may be paralyzed for some time, and the producing tissues need stimulating. She may develop a blood clot that starts in one of the vessels from the womb, and when this clot works its way through the circulation to the brain or heart she dies from apoplexy. Her womb may be thrown inside out, and in conjunction with this she may bloat, due to fermenting food. In fact, not long ago the writer was called to see a fine black Jersey, down, dead to the world with milk fever, her womb totally prolapsed and both sides of the abdomen almost tight as a drum from bloat. What would an owner, without any instruments of any kind, or lacking experienced skill, and to replace an everted womb is as hard a job as any we run against.

As we do not know the exact cause of milk fever, neither do we know what effect blowing air into the udder does. We find that if we give heart stimulants with a hypodermic syringe and leave medicines given by the mouth strictly alone until she can get up, and cover the animal with blankets, that she usually gets up in from two to six hours. In the nervous type we inflate the udder, but give narcotics, such as morphine hypodermically, or chloral hydrate by the rectum. The mortality in the simple, common cases is about three to five out of a hundred; in the nervous or eclamptic form about 20 to 40.

Suppose you get up early one morning and find your cow, recently fresh, stretched out with milk fever, what should you do? First of all phone your veterinarian. Tell him the history, so he will be prepared. While he is on the way fill a couple gunnysacks full of straw or hay, like pillows, and prop under head and try to get her up on her brisket. Milk out the udder and then cover her with blankets. Do not give any medicines by the mouth. If she is in a mud hole or snow drift or mixed up in a barb wire fence try to move her away from these. If you are away from expert assistance inflate the udder and tie inch bandages around each teat as far up to the udder as possible. Keep her up on her brisket with sacks and keep well covered.

But whenever possible get a veterinarian as quick as you can. Tell him it is a fresh cow and that she is down or staggering, and he will be prepared for milk fever, and you can have everything ready.

By doing this you will run a far better chance of saving your cow than by trying to save a few dollars and lose her.—Washington Farmer.

BUTTER WILL NOT GATHER

I have a nice Holstein cow, five years old that came fresh eight weeks ago and is giving ten quarts of milk twice a day. I only keep one cow and set the milk in pans, it raises nice thick cream, could almost lift it with a fork but we can not make butter out of it. We churn with a dash churn an hour or more it breaks and shows plenty of butter but it will not gather. Appears to be all in small grains about the size of rice. We strain the milk out, put water on it and it will all spread and float all over. Have tried different ways and can do nothing with it. It did the same last summer. The cow is on grass all day and stabled nights, has hay and some ground oats.—J. M., Carsonville, Mich.

CREAM that is too thin and cream that is too warm at the time of churning is a cream that churns only with difficulty. If you will place the milk in a deep bucket, cool at once after drawn and let the cream rise in this deep container the cream skimmed will be richer. Churning the cream at a lower temperature will also cause it to come in larger grains, about the size of corn kernels. When this size of grain is reached, the buttermilk is best drawn and an equal amount of cold water added. The churn can be given a couple of turns in the wash water and the water drawn off.—P. S. Lucas, Associate Professor of Dairy Manufacturers, M. A. C.

TESTS REQUIRED TO FREE HERDS FROM TUBERCULOSIS

THE number of tuberculin tests required to free herds of tuberculosis is a subject being studied by veterinarians of the United States Department of Agriculture. Records on nearly 25,000 herds show that 15,000 of that number were entirely free from tuberculosis on the first tuberculin test, accompanied, of course, by the removal of reactors. The second test "cleaned up" more than 4,600 additional herds. In other words, more than four-fifths of the herds tested were freed of the dread disease in not more than two tests made from six months to a year apart.

Occasionally, herds are found where the disease is extremely deepseated, and as many as eight tests are necessary to insure that all infected cattle have been removed. But such cases are extremely rare.

VETERINARY DEPARTMENT

HORSE KICKED ON HOCK JOINT

I have a horse that got kicked on the hock joint and the joint is enlarged some. Now I would like to take it off. Can you tell me what to do and the remedy?—L. W., Sterling, Mich.

YOU do not say how long ago your horse's hock was injured nor just where the enlargement is located on the joint. These would be important things to know before giving any prognosis or prescribing treatment. There are several chronic conditions affecting the hock joint that are incurable. Better have your local veterinarian make an examination of your horses hock. He will then be able to tell in all probability what the chances for recovery will be.—John P. Hutton, Assoc. Prof. of Surgery and Medicine, M. A. C.

PIGS ROOT EACH OTHER

We have some young pigs 2 months old. They are out on grass and get all the milk they want, but they root each other constantly. Can you tell us cause and a cure?—A. H., Caro, Mich.

THE rooting of one another of these pigs is doubtless due to some deficiency in their ration. I would advise that they be given access to a good mineral mixture. Either one of the following would be good: 30 lbs. bone meal, 30 lbs. finely ground lime stone, 30 lbs. salt, 10 lbs. sulphur; or a mixture of 10 lbs. 16 percent acid phosphate, 10 lbs. finely ground lime stone and 1 lb. of salt.

This trouble is occasionally caused by skin trouble. To overcome this the pigs should be sprayed occasionally.

It would also be advisable to give these pigs some grain or barley along with their milk.—Geo. A. Brown, Professor in Animal Husbandry, M. A. C.

Potato Growers Close Enthusiastic Meeting!

Go on Record for Standard Grades and Endorse Old Officers by Re-electing Them

THE Michigan Potato Growers' exchange closed its sixth annual meeting at Cadillac August 21st with the unaminous re-election of Fred Smith, of Elk Rapids, to the board of directors.

E. A. Rasmussen, of Greenville, was elected for three years to succeed Ernest Snyder, of Lakeview. The board of directors re-elected its present officers: Henry Curtis, Cadillac, president; Fred Smith, Elk Rapids, vice-president; S. E. Rogers, East Jordan, secretary and treasurer.

To Seek Change in Law

The most important action by the delegates was adoption of a resolution by which the central Cadillac exchange officers will work to get a bill through the legislature providing standard potato grades, similar to the apple and grape code, with penalties for violation, and an appropriation for its enforcement. The board also was instructed to abolish the system whereby cars are insured by the central exchange, leaving the risk to the locals interested.

The campaign for five-year crop contracts was supported strongly, R. A. Wiley, organization manager, reported. There now are 1,368 growers signed in the contract, with 298 seed dealers and 424 growers of certified seed also signed up 77 per cent of the growers called on.

Herbert F. Baker, Cheboygan gubernatorial candidate, who was once a president of the exchange, was the principal speaker at the annual banquet.

DOES DELTA COUNTY WIN?

I decided I would answer your article of August 16th entitled "Can You Beat This?"

We have corn 10 ft. 8 in. Robust beans 1 ft. 6 in. high and vines cover meadows so you can not walk through them.

The corn ground was alfalfa sod fall plowed and top dressed this spring. It is nearly in roasting ears. The bean ground is alfalfa sod plowed this spring. — D. R. Kirkpatrick, Rapid City, Mich.

Says Standardization Paid

W. H. Hartman, director of the state food bureau, declared standardization paid. Michigan potato growers a million and a quarter dollars last season by making a market for Michigan spuds and bringing a premium of from 15 to 40 cents a hundredweight for the branded chief Petoskey stock. The year before Michigan potatoes, poorly graded, sold for from 10 to 90 cents a bag less than those of other important producing states on all markets, including those of Michigan itself.

Professor R. J. Baldwin, of M. A. C., and Postmaster Perry F. Powers, of Cadillac, were the other speakers.

COUNTY CROP REPORTS

Menominee.—Crops here are excellent except corn which is two weeks or more behind the season.—Karl Knaus, County Agent.

Sanilac.—Due to heavy rains about one third of the hay is still in the fields. Wheat sprouting, possibly one fifth beans drowned out. Oats are down badly.—John D. Martin, County Agent.

Gogebic.—Hay crop good. Grains fair to poor. Corn will make poor ensilage. Potatoes slow, but promising. Unseasonably cool weather. Poor harvesting weather.—C. E. Gunderson, County Agent.

Lapeer.—Wheat good average 20-25 bushels. Oats good also barley. Beans and potatoes are fair. Corn poor needs lots of warm weather. Beets fair. Second cutting alfalfa fair.—A. J. Patch, County Agent.

Dickinson.—Potatoes looking good. 150 bushels per acre. Oats, barley and rye are good. Grass also is good. Not quite finished haying. Corn, probably no seed corn, but hope for silage. Alfalfa better than clover.—Art Lonsdorf, County Agent.

Schoolcraft.—Considerable haying still to be done, wet weather caused much dissolved hay. Oats and barley looking very promising. Potatoes seem to be setting heavily generally in good condition, we are afraid of considerable late blight may occur.—T. R. Shane, County Agent.

Manistee.—Oat harvest in progress with yield good. Potatoes are promising outlook. Wet weather causing disease development ruining many fields of beans. Little hope for mature corn. Pickle growers seriously troubled with anthracnose with losses heavy. Raspberry shipping season will close next week.—H. M. Vaughn, County Agent.

Presque Isle.—All crops look fairly good except corn which is backward and hay also was a short crop. Grasshoppers doing a lot of damage to oats in places. Farmers are busy cutting winter wheat and rye. Fall apples are quite abundant but winter varieties are a light crop. Lots of rain here lately. New seedings fair.—Fred Tulyetske, County Agent.

Lenawee.—Wheat good with average yield 23 bushels and highest reports 48 bushels. Barley good with small amount being threshed. Oats excellent with small amount being threshed. Hay good and second crop alfalfa now being harvested. Corn good where good seed used or well prepared soil. Feeder lambs and steers beginning to come in.—C. L. Coffeen, County Agent.

Muskegon.—Corn improved but still only 50 per cent of crop. Potatoes good yield of early crops, late crop looks good. Grain good crop some damage to grain in shock. Hay and pastures good and looks like good prospect for clover seed. Beans making good growth. Some damage from anthracnose. Most crops on low ground damaged to some extent by steady rains.—County Agent.

Barry.—Wheat good yield with good test; majority in danger because of continued rains. 20 per cent damage to date. Oats good crop; filled well; 10 per cent down impossible to harvest. Hay good; 10 per cent loss or in poor condition on account of rain. Corn backward: 50 per cent will not mature. Potatoes normal to good. Pasture good. Fruit 40 per cent of normal crop.—F. W. Bennett, County Agent.

Midland.—Cold nights and heavy rains the past week makes the corn crop and bean crop late and drowns beans in many places. Beans podding heavily but showing considerable disease in places. Potatoes and sugar beets looking very good. Threshing progressing rapidly. Wheat good quality and good yield but too wet to put in storage. Barley threshing beginning, with yield good. Oats all in shock and some in barns. Second cutting alfalfa being made. Good crop.—Roy W. Weinberg, County Agent.

NINE FOOT CLOVER IN LENAWEE

I have sweet clover on limed land that measures 9 feet 1½ inches. After cutting a field of alfalfa I found a stalk that was lodged so only the top was cut off, how much I don't know, and what was left measured 5 feet 4 inches.—H. S. Fish, Tipton, Mich.

Monroe.—Crops in this county according to report of farmers are as good or better than we have had in several years past, with the exception of corn which is probably two weeks behind the season and in many places of very poor stand because of poor seed used and the work of cutworms and grubs in the early part of the season. Many oats are still uncut because of light rains which we are having at the present time. As a whole the farmers are feeling a little better about their business and feel that more prosperous times are coming. Some wheat is threshed and is yielding a little better than average.

St. Joseph.—Wheat acreage somewhat reduced from that harvested last year, but yields range from 20 to 30 bushels and over on good soils. Mostly being threshed from the shock and suffering damage from the weather. Rye, reduced acreage and poor yields, grown mostly on the poorer soils. Oats, reduced acreage but a good crop despite late sowing. Now being harvested. Corn, about usual acreage, growing well and eared well where it has a chance, but many thin stands and some fields being abandoned to the weeds. Hay, about 12,000 acres of alfalfa a big crop first cutting, second cutting about ready and looking fine. A few good fields of clover harvested, not much other hay. Around 4,000 acres of alfalfa will be sown this year. Potatoes reduced but growing well. Bean acreage is unimportant in this county, but what there is are growing and podded well. Some Anthracnose present in them. Pastures are good and growing conditions good for all crops. What unfavorable outlook there is has resulted from too much wet weather, which has prevented taking proper care of crops.—L. R. Binding, County Agent.

WARNING!

Do Not Drive Your Automobile to the Fairs

Unless it is insured against Fire, Theft, Liability and Collision in the Citizens' Mutual Auto Insurance Company.

When full protection against the risk of what may prove a large financial loss may be had at so small cost.

Do Not Park Your Car on City Streets

Take it to a garage where you will be sure to find it on your return. Thieves watch for unsuspecting visitors and pick out their cars as easy prey. The small amount you pay for storage will be well earned.

Drive Carefully; Take No Chances

Most accidents can be avoided. Watch out for loose gravel at the new 35 mile speed limit. Stop at one side of the road when the glaring headlight fool refuses to dim his lights. Don't take a chance at the railway crossings—"Stop, Look and Listen!" will save you if you do it ALWAYS.

Before you start for the Fairs—call up the Citizens' Mutual agent in your locality—don't be satisfied with any other company—make them show their statements; your insurance is only as good as the company that writes it.

Almost any auto owner can tell you who your local Citizens' Mutual agent is—or write, phone or wire us and we will have our agent call AT ONCE, before you start for the fair.

W. E. ROBB, Secretary

Citizens Mutual Automobile Insurance Company

PREVENTION OF DISEASE IN POULTRY

As has been previously mentioned prevention is easier than cure. The first thing to be done in any case is to ascertain the cause and remove it.

Probably one of the most common troubles among flocks is that of colds, roup, etc. Chickens will stand a lot of cold if it is dry and free from draughts. One of the big problems of poultry raising is to solve the problem of keeping the poultry house dry.

This is best done by having the poultry house located on well-drained land, have the floor of the house at least eighteen inches above the outside ground level and fill in with coarse gravel or cinders.

Then see that the house is ventilated without draughts. Houses should face the South and have some sort of an opening on the South side. The house should be at least sixteen feet from front to back, and we would prefer it twenty feet. Then, with your roosts in the rear, the fowls are back away from the opening and not in much danger of draughts from the front or exposure. If your houses are more than twenty feet long, put in a solid partition as in spaces longer than twenty feet draughts are apt to develop. A house or pen twenty feet square is ideal for one hundred birds or four square feet of floor space per bird is about right.

To properly act for prevention of diseases it is necessary to know something of the things that cause the trouble. As explained above dampness and draughts are the main causes of colds in their various forms. If the digestive organs are affected the kind, quality and quantity of feed should be inspected. You should know whether there is any mold in the litter or feed; whether or not they have access to grit, shell and charcoal; whether or not they have been infected with parasites or germs that might cause disease.

If the fowls become lame it might be caused by rheumatism, injury or liver trouble.

Over-fatness causes trouble with the heart, liver and reproductive organs.

Build your houses so as to be dry and free from draughts. Feed sanely which means with good feed fed right. Supply fresh, clean water, grit, shell, charcoal and green feed and there should not be much trouble from sickness.

Use plenty of disinfectants. It is one of the best investments you can make. If the fowls are kept on the same ground for any length of time, sprinkle it with lime, spade or plow under and sow some quick growing green crop such as oats or rape.

Remedies may remove or destroy the cause of the disease; remove or offset the symptoms, and help to repair the affected tissues. They have their place but if proper methods of prevention are used there will be little use for them. However, they have their place and we do not believe it necessary to always use the hatchet as many advise.—"Those Nine Fox Brothers."

BUILDING STONE AND CEMENT POULTRY HOUSE

Kindly furnish me with information and details for building a stone and cement poultry house large enough to house two hundred hens. How many stones and sacks of cement would it require? Is a nearly square house practical now days? I see some are advocating that style. What should the proper dimentions be, also the right amount of light? The house I am about to build is to face the south.—A. W., Stockbridge, Michigan.

In order to accomodate 200 layers, we would suggest a building 40 feet long and 18 feet deep. This will provide ample room for the larger American breeds. A house of these dimensions will require approximately six cubic yards or six loads of stone, and twelve cubic yards of gravel, in addition to eight barrels of cement. This ratio permits the use of thirty-three per cent stone in constructing the foundation and six inch wall.

The Michigan poultry house planned by the M. A. C. seems to be giving the most satisfactory results in this states. It has been designed, lighted, and ventilated to provide the greatest amount of comfort under the variable weather conditions of this state.—E. C. Foreman, Professor of Poultry Husbandry, M. A. C.

(Editor's Note: — Any person wishing a copy of this plan can secure one by writing to The Business Farmer or the Department of Poultry Husbandry, M. A. C.)

HENS HAVE TUBERCULOSIS

Would like advice on how to disenfect our poultry house. Our veterinarian said the hens had tuberculosis and I have disposed of them. He said I should dispose of all my chickens as soon as they were large enough for broilers. How long before I can put new chickens in my houses?—Mrs. C. H., Byron, Mich.

The so-called normal mortality in commercial laying units varies from ten to fifteen per cent each year. Before disposing of your entire flock, I would suggest forwarding one or two speciments to Doctor Stafseth of the Bacteriology Department, East Lansing. Ordinarily, the severe losses occur among the older stock, and if young chicks are raised on a clean range away from the parent flock, the danger of transmitting tuberculosis from old to young stock is not so great. To our knowledge, this disease is not transmitted from the adult to the offspring through the egg, and if you have a highly bred flock and wish to continue this same line of breeding, by proper precaution the young stock could be matured with the assurance that they are fairly clean and free from this disease.

If your mortality among the older birds is extremely heavy, it undoubtedly would be advisable to dispose of practically the entire flock. We have found a higher percentage of tuberculosis present in poorly lighted and poorly ventilated buildings, with dirt floors, and not having dropping boards which permits of better sanitation. These housing conditions should be corrected and the house given a thorough cleaning and disinfecting. This calls for a thorough scrubbing of the walls, and floors which should be followed by an application of some good coal tar disinfectant.—E. C. Foreman, Professor of Poultry Husbandry, M. A. C.

FOOD VALUE OF EGGS

In these days of the popularity of vitamines and calories in the every day scheme of eating, eggs as body builders are not to be ignored. Eggs contain so much of fuel, energy and tissue building materials as to be almost a perfect food in themselves. Protein in the form of albumin is found in the white. Fat in a finely emlusified form, similar to the fat in milk, is found in the yolk. The protein contains sodium chloride, potassium salts and sulphur, all necessary to perfect health. The iron compound forms the material from which the haemoglobin of red blood corpuscles is made.

Few foods are as rich in vitamins as are eggs. Fat soluble A, essential for growth, and water soluble B, valued for its curative properties as well as for body development, are found in abundance in the yolk. On account of the richness of iron in eggs, they are one of the first foods to be added to the diet of the growing child. In hospitals eggs are found to be almost indispensable in the diet of undernourished, anaemic, convalescent and tubercular patients.

Many people have been of the opinion that brown-shelled eggs have a higher food value than those with a white shell. Extended study of the physical properties and chemical composition of eggs to determine whether or not this was true has proved that there are practically no differences, so far as food value is concerned, between the white-shelled and the brown-shelled eggs.

Eggs are easily digested and quickly absorbed. In connection with other work with eggs, their digestibility was studied at the Minnesota experiment station.

Five experiments were made by means of a pepsin solution to determine the digestibility of eggs cooked under different conditions. Results indicated that while the method of cooking has some effect upon the rate of digestibility, it does not materially affect the total digestibility.

CHICKENS TRESPASS

I would like to get a little of your advise in regards to chickens. Has a person a right to raise about 800 chickens on a small piece of ground, a lot and a half, in a village and then turn them right out to the public and let them run and destroy people's gardens? My neighbor, is raising 800 chickens on a small piece of ground, has no park, don't intend to shut them up and there is a fifth of them that stay over on my ground and destroy my lawn and garden. I do not keep any chickens and would like to have a garden and have more use of my ground for my own benefit. Have stood for this for four years. This is a small village and is not incorporated. Now what I want to know is there any way that she can be made to take care of her poultry?—M. W., Middleton, Mich.

There is no state law regarding trespassing chickens. If the village is not incorporated there should be a township by-law to take care of this. See the supervisor. If there is no township regulation preventing this annoyance, you will have to put a good fence around your garden and if the chickens continue to get in, put them up and hold them until the owner pays the damage they did.—Asst. Legal Editor.

CHICKS GO BLIND AND DIE

I sent for fifty day-old chicks and received them all in good condition. After I had them for a week or two they began to go blind and then their wings would droop, some would shake until they could hardly stand up and they would go blind and die. Could you tell me what causes this? I feed them and water them every day.—F. C., Cathro, Michigan.

The flock of chicks referred to were evidently free from Bacillary White Diarrhea, which to our knowledge, is the only disease that might be introduced in purchasinging day old chicks. I am inclined to believe that the blindness, drooping wings, and the paralyzed condition of the chicks are largely the result of faulty nutrition. Similar conditions have resulted when chicks were kept on a very restricted diet containing insufficient quantity of these new food factors referred to as vitamins. Ordinarily, such chicks will respond to a treatment which includes a combination of tomato juice and cod liver oil. The cod liver oil should be given at the rate of one half pint to each 500 birds and can be evenly distributed by mixing it in rolled oats and bran. Cod liver can be emulsified with either boiling water or tomato juice without its value being destroyed. This may be necessary in order to get a sufficient liquid for proper distribution so that the chicks will get a sufficient amount to correct this nutritional disturbance. These chicks may also be given hard boiled eggs with very beneficial results.—E. C. Foreman, Professor of Poultry Husbandry, M. A. C.

GET YOUR COAL FREE
Special Offer to Michigan Business Farmer Readers

The largest concern of its kind in the world, exclusively delivering coal direct from car to consumer, with a long established successful record, the Popular Coal Company, 1509 Coal Exchange Building, Chicago, Illinois, is offering this unusual opportunity to one coal user in every neighborhood who has a few hours spare time. This is its method of quickly introducing the finest grade, freshly mined, free-burning coal, which is being sold direct to user at remarkably low prices. Man of good standing in his community can get his coal free. Write this firm today and ask them to explain this offer.—Adv.

How to Make Durable, Strong Concrete

By H. H. MUSSELMAN

Agricultural Engineering Department, M. A. C.

CONCRETE is a material which is so satisfactory for many kinds of construction work that very poor work may be done in its preparation and a degree of success still result. Time is an important factor in determining results under actual construction conditions, and so improvements come slowly. For this reason studies of the materials in the experimental and testing laboratory show in what ways better concrete may be produced. They also indicate that better work can often be produced at less cost of both material and labor.

RESULTS OF TESTS OF CONCRETE MIXTURES

No.	Mix	Slump	Age in days	Curing	No. of beams	Average load in lbs. breaking	Remarks
1	1:2:4	0.8	35	Sprinkled daily	10	920	
2	1:2:4	1.0	35	Sprinkled daily	10	950	
3	1:2:4	1.5	35	Sprinkled daily	10	896	
4	1:4½	1.0	25	Sprinkled daily	10	810	Bank run
5	1:4½	1.0	25	Sprinkled daily	10	501	Fine sand
6	1:1:2	1.0	25	Sprinkled daily	10	935	
7	1:4:8	1.0	25	Sprinkled daily	10	527	
8	1:2:4	1.0	29	Dry	9	696	
	1:2:4	1.0	29	Dry	5	546	5 hrs. set before placing in forms
9	1:2:4	1.0	29	In wet sand	5	1018	

Tests of small beams 3⅝" x 3⅝" x 16" were made by supporting the ends of the beams on parallel supports 16" apart and applying a load on the top of the beam, exactly at the center, until breakage occurred, with the results given in the following table. The testing machine was so devised that a jack was used to apply the force necessary to break the beam, and platform scales were used to weigh the breaking load.

The beams were made and tested under similar conditions insofar as possible. Ten beams of each kind were tested so that extreme variation, due to flaws in the beam or other unusual causes, could be eliminated. An average of the breaking load was taken of the ten beams as representative of the group. It should be added that strength is considered by engineers as one of the best criterions of good concrete. Strength is at the same time a measure of water-tightness and wearing qualities.

When put in forms, the wetness was indicated by the slump or relative amount of settling. This was measured, when the concrete was ready for the forms, in a tapering circular form 12 inches high, 4 inches in diameter at the top, and 8 inches in diameter at the bottom. Slump shows the tendency of the material to flow as a liquid. A slump of 1.5 is a wet concrete which will flatten out to less than 5" when the form above described is removed.

The mix, when indicated as 1:2:4, means 1 part cement, 2 parts sand or material which will go through a ¼" screen, and 4 parts gravel, which is the material which will not go through the same screen. Note that in every case except the bank run, the volume of sand was one-half the volume of gravel used. Bank run averages perhaps 2 to 3 parts sand to 1 of gravel.

Some variation in time of setting was permitted on account of schedule, but beams tested at the same age are comparable, Curing was done by sprinkling daily with the beams in piles of ten, except in case of beams listed as No. 8 to which no water was added after placing in the forms. The breaking load represents the weight necessary to break the beam when applied at the center of the beam on top.

Outstanding results are shown in several cases. Beams (7) contained practically one-half the amount of cement as (5), yet showed a greater breaking strength, a direct comparison of fine sand concrete and sand and gravel concrete. (9) contained practically the same amount of cement as (8) but show nearly a 5 per cent higher breaking load. This indicates that water is a cheap ingredient to use in concrete while curing. (2) indicate best wetness of mix, or slump of 1. This corresponds very closely to a quaking mix or one which will shake slightly when patted with a shovel. (3) indicate too much water in mixing, the strength being much less than (2).

Other comparisons can be made. The tests were not extensive enough to be conclusive, nor are the breaking load figures of value any more than for showing differences. The results indicate however, that it is possible to effect the strength of the product greatly in the wetness of the mix, the proportions, grading of material, and method of curing.

THE TWO OUTLOOKS ON LIFE

(Continued from Page 7)

when he wanted to. But he couldn't. The tyranny of evil increased and he is swept on and on. Pathetic as it is, "Many are they that enter in thereby." Why? Because the many drift. The few seek. "Seek and ye shall find." The narrow way is found by that one who seeks and desires it.

Now, we have come to the two ends. "Destruction." "He that pursueth sin, pursueth it to his own death." That ought to be warning enuf. So, let us look now to that other end of life, "eternal life." This is found thru traversing the narrow way. Press this home to your heart: The main thing about a road is not the difficulties of travel, but the end toward which it leads. The narrow way leads home. Every step in Grace and holy purpose brings us nearer. This comfort of our text swallows up the pangs and travails along the way. Jesus went that way and so he knows. And he yet declares, "I am the door," "I am the way."

KDKA DROWNS OUT OTHER STATIONS

(Continued from Page 9)

Looser coupling between the primary and secondary of your coupler will also help you tune out undesirable stations.

You can add one or two stages of amplification to a crystal set. The output terminals, where you now connect your phones would be connected to the imput terminals of the amplifier.

WOULD TEST NEIGHBORS COWS

I have a Babcock milk and cream tester and am thinking of testing some of my neighbors' cows. What would be the proper charges to make per cow? I am a member of the Protective Service Bureau.—H. J. B., Allegan, Mich.

I DO not know of any other way of getting at the charges for testing cows than to make a straight rate according to the amount of labor and supplies that you use in testing. This can easily be figured out when put on the time basis. There is none of this sort of work done at the present time. If farmers want their cows tested, the creameries or milk stations usually do the testing free in order to encourage the keeping of records.

The only other way that testing is done for the farmers is through cow testing associations where a number of farmers go together and hire a man to do the testing by the month. This usually costs an average of $3.00 a day for one day out of each month. This kind of work not only includes the butterfat record but the milk records and the feed records.

If you are interested in a position for testing cows through cow testing associations we will tell you more about the work as we have opportunity to use men in this work since we have nearly 100 associations now in operation in the state. —O. E. Reed, Professor of Dairy Husbandry, M. A. C.

The Schools and The Railroads

Teachers in Michigan's primary schools are being supported, to a large degree, by taxes paid by the state's steam Railroads. In many counties, the whole cost of these schools is carried in this way.

Michigan is justly proud of these schools, and of the capable teachers who preside over them.

And Michigan's 24 Railroads are proud of the result which their tax payments have made possible.

These primary school taxes have become a part of the delicate balance which laws have established between Railroad receipts and expenditures.

This balance can be preserved with a steady and continued improvement in Railroad service, as the past two years have amply proved.

To destroy this balance by increasing Railroad taxes, or by imposing any additional burden on your carriers, would be a calamity for the Railroads and a severe blow at Michigan prosperity.

All we ask is a fair chance to keep on making good for you.

Write us freely about any phase of this matter that interests you.

Michigan Railroad Association
500 Railway Exchange Bldg., Detroit, Michigan (10-28)

"We Serve Michigan"

MARKET FLASHES

Foote Says Business Is Improving

Good Demand For Hogs—Less Cattle From West —High Prices For Grain and Corn

By W. W. FOOTE, Market Editor.

IN all respects general business has been growing in volume for several weeks, and further improvement is expected, especially in the foreign trade of the United States, now that the serious differences between France and Germany have been amicably adjusted. Of course considerable time will be required to bring about a return to normal conditions in the war stricken countries of Europe, but it is encouraging to see the beginning of better times. Our domestic trade is moving along satisfactorily on the whole, and although the purchasing power of the dollar is much less than before the European war, farmers are obtaining as a rule decidedly better prices than a year ago. The banks are well supplied with funds, and rates of interest are unusually low, the Chicago banks making loans at 4 to 4½ per cent. All the grains are bringing much higher prices than in recent years, with corn showing far the greatest advance, due to the promised unusually short crop. In a recent review of conditions by a leading Chicago bank, it is shown that an analogy exists between 1879, 1896 and 1924. In those former years short crops and distress in Europe created a demand for wheat which brought prosperity to this country. This year only average crops on in Europe and a reduction of 40 per cent in the Canadian wheat crop will leave this country as the chief source of the world's wheat supply. During the last season Canada led the world in wheat exports, with Argentina second. Of late European stocks of wheat have been lowered, and Germany and Italy are eating war bread. The writer of this review points out that the American wheat crop of 589,000,000 bushels of winter wheat recently harvested and 235,000,000 bushels of spring wheat promised will supply the demand and bring better prices for farmers, so that there will be a fair profit. As for corn, conditions are made rather unusual by the promise of a small crop in a large extent of territory and a good yield in more favored districts. Evidently, this will greatly enrich the relatively few fortunate farmers and bring in little profit for the many with poor crops. Live stock interests are largely profitable so far as well fattened cattle and hogs are concerned, while lambs are a great source of profit. Farmers generally are not putting mortgages on their farms, and intense and diversified farming is the rule.

Important Warning

The Chicago Live Stock Exchange has issued the following statement: "The big hold-over hog supply shown every night consists of fully ten thousand thin, skippy sows that are almost unsalable. Some of these sows have been in the stock yards for a week without any bid better than $6. The country should be warned against shipping any of these sows at this time, and they should also understand that the big hold over reported by the government each night does not consist of good, merchantable hogs, as the supply of good hogs is bought up very quickly each day."

High Prices for Grain

All the grains are selling at unusually high prices owing to matural causes and not to legislation. By simply carrying out the advice of the Department of Agriculture to curtail the wheat acreage, the crop is much reduced and the law of supply and demand makes profitable prices once more. With corn the case is quite different as farmers in the corn belt states generally devoted about the customary number of acres to this cereal, but weather conditions were against them, and a short crop is promised as a natural result of a very late start and wet and cold weather much of the summer. Recent sales were made on the Chicago Board of Trade of September wheat at $1.29, comparing with $1 a year ago; September corn at $1.17, comparing with 83¾ cents a year ago; September oats at 54 cents, comparing with 39 cents a year ago; and September rye at 92½ cents, comparing with 65 cents a year ago. A little over two years ago September corn sold as low as 57½ cents, while September oats sold down to 30 cents. Oats having been selling relatively much lower than corn and this naturally leads to the extensive substitution of oats for corn on farms and selling of old corn, although oats have sold 16 cents above the low time of this season. Fluctuations in corn are unusually wide frequently, and fluctuations have been in some days as much as five to ten cents a bushel. An early frost would do a world of injury to the corn crop of this country, and that would mean a great falling off in the supply of merchantable corn. Corn is too high to export freely, but oats, rye and barley are exported fairly, as is wheat. Marketing the winter wheat crop goes on actively, and the visible wheat supply is increasing at a lively pace, the wheat in sight amounting a short time ago to 58,107,000 bushels, comparing with 48,752,000 bushels a year ago. Spring wheat is now moving to market, and in a short time there will be a combined marketing of winter and spring wheat and not unlikely lower prices. Probably, it will be well for the Michigan farmers to not wait too long to market their wheat. At the same time good prices are expected, and a short time ago December and May wheat brought the highest prices paid this year.

Western Cattle Supplies

There will probably be around 500,000 head less cattle marketed from the Western region during the last half of 1924 than were marketed during the similar period last year according to an estimate made by the United States Department of Agriculture. The number to be shipped this year is estimated at 4,300,000 compared to 4,800,000 marketed last year.

This estimate is based upon reports from the different states covering the situation as of August 1, giving information as to range and feed conditions, financial situation of cattlemen, estimated supplies of cattle and expressed intentions of producers as to the numbers to be marketed. Changed conditions subsequent to August 1 may alter the situation and the number that will be actually marketed may be larger or smaller than this estimate depending upon the prices of cattle, supplies and prices of feed and financial developments.

The region covered by the estimate includes the states of North Dakota, Oklahoma and Texas, the areas in South Dakota, Nebraska and Kansas west of the 100th meridian and all other states west of these. A different situation is indicated in various areas of this western region. In the seven states west of the Continental divide the greater part of whose cattle usually move to the Pacific coast or local markets, the number of cattle to be marketed is indicated as larger than last year, the figures being 860,000 this year and 780,000 last year. This situation is due to the drought condititon prevailing in nearly all of this area and the prospective high prices of feed and low prices of cattle. Because of this feed situation it is probable that fewer cattle will be winter fed for market this coming winter than were fed last and that considerably more cattle, especially feeder stock, will be shipped to middle-western markets this fall than last.

In the area including the western parts of South Dakota, Nebraska and Kansas and the states of North Dakota, Montana, Wyoming and Colorado it is estimated that 180,000 less cattle will be shipped this year than were marketed last, 1,640,000 head this year against 1,280,000 last. In most of these states winter range feed promises to be fairly plentiful and supplies of hay and forage sufficient for winter needs. Financial conditions in several of these states, however, are quite serious and may force considerably larger shipments than have been estimated.

In the southwestern area, covering the states of Oklahoma, Texas and New Mexico, the estimated marketings are about 365,000 less than those of last year, 1, 838,000 compared to 2,203,000. Range and pasture conditions in most of this area were quite favorable up until July 1 but since then there has been considerable deterioration because of drought. The supplies of forage, however, will be considerable and winter pasture, while of short growth, promises to be of good quality and the large wheat crop and prospective cotton crop are helping considerably the general financial situation.

Since such a large part of western cattle are stockers and feeders, the demand for such cattle in the corn belt this fall will be a big factor in determining the actual marketings of western cattle. The extent and character of this demand is at present very uncertain and will remain so until the outcome of the corn crop can be more definitely determined. Supplies of pasture, hay and roughage are quite large throughout most of the corn belt and cattle will be needed to utilize them. If there is a large amount of unmarketable soft corn, as now seems probable, in most of the states east of the Missouri river a big demand for feeder cattle for a short feed will presumably develop. But the high prospective market price for sound corn will tend to reduce the demand for feeders in the states that produce it. The best corn prospects at present are west of the Missouri river and these states were very large purchasers of feeding cattle last year.

Prices of both stocker and feeder cattle are a little lower now than at this time last year and the trend of prices during the next three months is very uncertain. The effect of low prices upon shipments is also uncertain. They may reduce shipments in the case of growers who are financially able and have the feed to hold back cattle but they may increase them by further discouraging growers and financial interests that have been staying in the business in the hope of better prices or where money will be needed to purchase high priced feeds.

Fat Cattle Sell Well

At this season of the year prices for cattle always widen out much more than at other times, due to the marketing of numerous consignments of grassy cattle from farms and ranges. Of late this has been an important feature of the Chicago market, and grassers have been quick to sell lower on days when the relatively few offerings of corn-fed cattle sold readily at steady values. Fat yearling steers and heifers have sold best of all, instead of going at a discount, as was the case with yearling steers several weeks ago. The tendency at this time is for country shippers to send in more cattle than are wanted to meet the requirements of the packers and eastern shippers, and they stick to the old plan of overstocking the Monday market, thereby depressing prices on that day, the arrivals on the opening day last week aggregating 25,457 head. As compared with a year ago, the better class of beeves have been selling at lower and the commoner lots at better prices. Limited numbers of prime finished heifers are taken at extra high figures, and the other day a sale was made of 90 fat heifers averaging 778 pounds at $10.50, but such sales are exceptional. Canning cows are selling extremely low, and they are very unprofitable cattle for farmers to handle. Choice veal calves have been high sellers, selling at $12 to $14 per 100 pounds, with common kinds at $6 and over. Because of the high price of corn, farmers are not favorably disposed toward feeding cattle, and the demand is mostly at $5 to $6.50. Western range cattle coming on the Chicago market are running very largely to the stocker feeder order, and sales were made of such at $5.75 to $7.25, but mainly at $5.75 to $6.75. Prospects are that less corn will be fed to cattle than usual owing to its dearness, and in all probability well finished cattle will go higher ultimately. During the past week beef steers sold at a range of $6.75 to $11.25 for common grassers to prime

yearlings, with the bulk of the sales at $8.75 to $10.75 and the best heavy beeves at $11.10. No good steers sold below $9, and prices for desirable handy weight offerings were well maintained, but the market for grassy cattle was on a lower scale, while heavy steers were largely 50 cents lower. In short, most cattle except good and choice yearlings were from 25 to 75 cents lower. Cows and heifers with any quality sold at $3.25 to $10, while bulls sold at $4.50 to $7.50. A year ago beef steers sold at $6.25 to $10, while bulls sold at $3 to $7 and canner and cutter cows at $2 to $3.15. Stockers and feeders sold at $4.50 to $7.50. A year ago beef steers sold at $6.25 to $13. Combined cattle receipts in twenty markets for one year to late date amount to 8,031,000 head, comparing with 8,257,000 a year ago and 7,808,000 two years ago.

Outlook For Hogs

So long as owners ship in large supplies of hogs, bad breaks in prices must be expected, but later on much reduced supplies may be looked for. Recently the receipts in the Chicago market have been much too unevenly disturbed causing large fluctuations in prices. For instance, on Monday of a recent week the arrivals reached 49,635 hogs, followed by 24,000 on Tuesday. Unfortunately, large numbers of sows are included in the arrivals, and a short time ago fully 10,000 thin, skippy sows that were almost unsalable were included in the held-over supply. Despite excessive supplies at times, prices continue to rule far higher than in recent years, with eastern shippers very fair buyers. Recently supplies have fallen off, and prices advanced under good buying by local packers and eastern shippers, heavy butchers topping the market. Combined receipts in twenty markets for the year to late date amount to 27,765,000 hogs, comparing with 27,395,000 a year ago and 21,271,000 two years ago. A year ago hogs sold at $6.35 to $8.95 and two years ago at $6.25 to $9.55. High prices for hogs have brought about much higher prices for fresh and cured hog products and lard, and their sales are falling off. Late sales of hogs were at a range of $7.90 to $10.10.

PRITCHARD'S
WEATHER
FORECAST
INTERPRETED BY THE STARS

Week of August 31

At the very beginning of this week thunder showers and moderately heavy rains with local wind storms are expected in Michigan but these conditions will soon pass bringing generally clear weather but slight temperature variations.

About the middle of the week weather conditions will become threatening and cloudy with many sections receiving scattered rainfall. The storm, itself will not be severe at this time but the temperature change following the storm center will be radical. Minimum temperatures at the end of the week will range in the forties.

It is expected that sections of the upper peninsula and some interior counties of the northern lower peninsula may be visited with frost during this or next week.

Week of September 7

Unseasonably cool weather is expected in Michigan at very beginning of this week. Change to much warmer will be felt in the state about Monday or Tuesday and continue warm until after the middle of the week.

During the middle days of the week there will be numerous thunder showers but these will be well scattered throughout the territory leaving much room for sunshine and fair weather during the some dates.

During the latter part of the week temperatures will take a sudden drop to readings below the seasonal normal.

The average temperature trend for this part of the country during most of September will be downward until near the close. The most noticeable warm spells for the month will be near the 11th, and 16th to 20th.

Market Your Fat Cattle

A Michigan farmer who is the owner of a bunch of fat cattle asks THE BUSINESS FARMER whether he shall sell them now or hold them longer, giving them a chance to get fatter. He says he cannot hold them any longer than up to the first of November, as he has not the barn room. In answer, it may be said that no one can tell how cattle will sell in the future, but it seems a good policy to market them when they are fat and bring good prices, taking advantage of any advances in values. At the present time feed is dear, as every farmer knows, and heavy steers are declining in price, although still selling at high figures. In feeding cattle it is well to keep track of the cost in fattening and the ruling market price. It is an old saying that no farmer ever went broke in selling at a good price. Just now handy weights are the favorites.

The Lamb Market

The number of sheep and lambs that will probably be shipped from western sheep states from August 1 to the end of the year is estimated by the Department of Agriculture at around 775,000 head more than the number marketed for the same period last year. Fat lambs have been selling very very high in the Chicago market, common to prime offerings going at $9 to $14.35, with feeding lambs much wanted at $12 to $13.25. At this time in 1915 the best lambs sold at $9.50. Sheep and yearlings are bad sellers at a big decline in prices.

(Mr. Foote will be glad to give his best advise on Markets at any time. Write him in care of The Business Farmer, no charge to subscribers.)

LIVESTOCK MARKET

DETRIOT, Aug. 27.—Cattle—Receipts 199; market steady but slow. Cured His Rupture

I was badly ruptured while lifting a trunk several years ago. Doctors said my only hope of cure was an operation. Trusses did me no good. Finally I got hold of something that quickly and completely cured me. Years have passed and the rupture has never returned, although I am doing hard work as a carpenter. There was no operation, no lost time, no trouble. I have nothing to sell, but will give full information about how you may find a complete cure without operation, if you write to me, Eugene M. Pullen, Carpenter, 44L Marcellus Avenue, Manasquan, N. J. Better cut out this notice and show it to any others who are ruptured—you may save a life or at least stop the misery of rupture and the worry and danger of an operation.—(Adv.)
